**Table 5.2** Subject specification

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>C1</b>	
<b>Level of studies: Second</b>					
<b>Course: Anatomy</b>					
<b>Course Leader(Name, middle letter, surname): Dinka S. Mucić</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 16</b>			<b>Year of the study: I / 1<sup>st</sup> and 2<sup>nd</sup> semesters</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20ANAT</b>		
<b>Objectives of the course:</b> The learning objective of this course is to equip students with the practical and theoretical knowledge of the systematic and topographical human anatomy.					
<b>Outcomes of the course:</b> After attending this course and passing the exam, the students should demonstrate the knowledge of: -Morphology and topography of bone and soft tissue structures of upper and lower limbs -Structure and content of the thoracic cavity -Structure and content of the abdominal cavity -Structure and content of the pelvic cavity -Morphology and topography of the bones and joints of the head and neck -Blood vessels and the nerves of the head and neck -Structure of the oral cavity and its walls -Structure of the pharynx -Structure of the nose and paranasal sinuses -Structure of the larynx -Structure of the organs of sight, hearing, and balance -Morphology and topography of the central nervous system					
<b>Contents of the course:</b> Bones and soft tissue structures of the arm, leg, thorax, abdomen and pelvis. Bones, joints and soft tissue structures of the head and neck. The central nervous system (Medulla spinalis, encephalon).

<b>Study Programme: Integrated Studies of Dental Medicine</b>			<b>C2</b>
<b>Level of studies: Second</b>			
<b>Course: General and Oral Histology and Embryology</b>			
<b>Course Leader (Name, middle letter, surname): Vesna Danilović</b>			
<b>Course status (compulsory/elective): Compulsory</b>			
<b>ECTS: 12</b>		<b>Year of the study: I / 1<sup>st</sup> and 2<sup>nd</sup> semesters</b>	
<b>Entry requirements:</b>		<b>Course code:ST20HIST</b>	
<p><b>Objectives of the course:</b>                  The aim of the course is to provide the students with the knowledge of the structural organization of cells, tissues and organs, including the basic principles of their integration into larger units. The students will also acquire the knowledge of their origin and development.</p>			
<p><b>Outcomes of the course:</b></p> <ol style="list-style-type: none"> <li>1. The student is capable of identifying and analysing all tissues and organs at a microscopic level.</li> <li>2. The student recognizes embryonic tissues and stages of the development of all tissues, especially the head and neck tissues and organs. Students understand the basic developmental processes and mechanisms that lead to developmental anomalies.</li> <li>3. The acquired knowledge enables the students to understand the normal function of cells, tissues and organs. The knowledge of embryology enables the students to understand the nature and mechanisms of developmental anomalies.</li> </ol>			
<p><b>Contents of the course:</b>                  Histological organization and development of four basic tissue types: epithelial, connective, muscular, and nervous. Organs and systems of organs: circulatory, urinary, digestive, respiratory, endocrine, nervous, immune, liver and pancreas, skin and senses. Tissues and organs of the oral cavity: histological structure and development.</p>

<b>Study Programme: Integrated Studies of Dental Medicine</b>		<b>C3</b>	
<b>Level of studies: Second</b>			
<b>Course: General and Oral Biochemistry</b>			
<b>Course Leader (Name, middle letter, surname): Ivan S. Dožić</b>			
<b>Course status (compulsory/elective): Compulsory</b>			
<b>ECTS: 10</b>		<b>Year of the study: I / 1<sup>st</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):/</b>		<b>Course code: ST20BIOH</b>	
<p><b>Objectives of the course:</b>                  Students will acquire a basic knowledge of the chemical structure of biomolecules, synthesis and degradation of organic molecules, as well as the regulatory mechanisms of these processes. Students will acquire the knowledge of the biochemistry of saliva, dental tissues and dental biofilm.</p>			
<p><b>Outcomes of the course:</b>                  After completing this course, the student should demonstrate:</p> <ul style="list-style-type: none"> <li>- Basic knowledge of the biochemical characteristics of biomolecules</li> <li>- Knowledge of enzymes</li> <li>- Basic knowledge of the principles of metabolic processes in the human body (carbohydrates, lipids and proteins)</li> <li>- Knowledge of biochemical organization and processes of certain tissues and organs, including their connections and interdependence</li> <li>- Knowledge of hormones and their regulatory mechanisms</li> <li>- Knowledge of the metabolism of water and bioelements</li> <li>- Basic knowledge of clinical and diagnostic importance of determining certain biochemical parameters in body fluids and secretions (blood serum, saliva)</li> <li>- Knowledge of the biochemical composition of dental tissues</li> <li>- Knowledge of the biochemical composition and secretion of saliva</li> <li>- Knowledge of the biochemistry of dental biofilm</li> <li>- Knowledge of the biochemical basis of dental caries and periodontal disease.</li> </ul>			
<p><b>Contents of the course:</b>                  Chemical bonds and structure of biomolecules, especially carbohydrates, lipids and proteins. Review of the basic principles of biochemistry and molecular biology. Particular emphasis will be placed on a broad understanding of the chemical processes occurring inside living systems in terms of their metabolism, as well as on the structure-function relationship of biologically important molecules. Additionally, important concepts such as bioenergetics, biological catalysis and metabolic pathways (metabolism of carbohydrates, lipids and proteins) as interacting regulatory systems will be included. This course will also provide students with a thorough understanding of the basic principles of biochemical processes related to oral health. These will be covered within the following 3 units: biochemistry of saliva, biochemistry of dental tissues, and biochemistry of dental biofilm.</p>

<b>Study Programme: Integrated Studies of Dental Medicine</b>			<b>C4</b>	
<b>Level of studies: Second</b>				
<b>Course: Biology and Human Genetics</b>				
<b>Course Leader (Name, middle letter, surname): Jelena M Milašin</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 10</b>			<b>Year of the study: I / 1<sup>st</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20GENE</b>	
<b>Objectives of the course:</b> To provide future dentists with the most relevant insights into the biology of the cell and introduce to them the process of inheritance at the molecular level, chromosomal level, individual and population levels.				
<b>Outcomes of the course:</b> After successfully completing the course, the student should be able to: <ul style="list-style-type: none"> <li>- understand the basic concepts of cytology, structure and function of major cellular organelles, and some important processes related to cell biology (intercellular communication and transport, cellular differentiation, aging and death, cell cycle control, types of cell division)</li> <li>-understand the basics of molecular biology (nucleic acid types, replication, transcription, translation, control of gene expression)</li> <li>-explain the mechanisms of mutagenesis and the consequences for human health, as well as the mechanisms of DNA repair</li> <li>-explain the basic principles and rules of inheritance of monogenic and polygenic normal and pathological traits</li> <li>-understand the basic concepts of cytogenetics, its medical significance and application in clinical practice</li> <li>- explain the mechanisms of occurrence of numerical chromosome aberrations and the most common syndromes with their main features</li> <li>-understand the mechanisms of structural chromosome aberrations occurrence and their phenotypic effects, i.e. their significance for humans and their offspring</li> <li>-connect genetic changes to the process of tumorigenesis, i.e. to the multistage mechanism of normal cell transformation into malignant.</li> </ul>				
<b>Contents of the course:</b> The student will be introduced to cell components, prokaryotic and eukaryotic cell structure, cell morphology, structure and function of cell organelles, cell transport, cell cycle and its control, cell divisions, cell senescence and death. Then, the student will be acquainted with the structure of DNA, its physico-chemical characteristics and biological function, eukaryotic gene organization, DNA replication, transcription, translation and regulation of gene expression, basic concepts of mutagenesis (gene mutations definition, classification, chemical and physical mutagenesis and mechanisms of DNA repair). The student will also be introduced to Mendelian and non-Mendelian inheritance (monogenic traits, autosomal dominant and recessive inheritance, X-linked dominant and recessive inheritance), genetic polymorphisms, linked genes, polygenic traits, multifactorial inheritance. Students will also acquire knowledge in the field of cytogenetics and karyotype analysis, main techniques applied in cytogenetics, numerical and structural chromosome aberrations and principal syndromes caused by chromosomal aberrations. Finally, the course also includes the basic principles of population genetics and oncogenetics.

<b>Study Program: Integrated Studies of Dental Medicine</b>				<b>C5</b>	
<b>Level of studies: Second</b>					
<b>Course: English Language</b>					
<b>Course Leader (Name, middle letter, surname): Irena V. Aleksić-Hajduković</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 6</b>			<b>Year of the study: I / 1<sup>st</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years): /</b>			<b>Course code: ST20ENGL</b>		
<p><b>Objectives of the course:</b>                  Students will acquire the basics of English for Medical Purposes (EMP) and English for Dental Purposes (EDP) while improving their reading, speaking, listening and writing competencies in order to enable them to use the English language to: communicate with patients and colleagues efficiently; take part in continuing professional development (CPD) programmes; skim and scan scholarly literature and electronic sources for relevant information.</p>					
<p><b>Outcomes of the course:</b>                  After completing this course, the student should be able to:                  - use the basic English terminology related to medicine and dental medicine;                  - identify the morphological processes in terms of the basic word structure of medical/dental terms in English and apply them to acquire new complex terms;                  - differentiate between professional English terms and their equivalent terms used by patients;                  - read relevant publications critically and analytically;                  - skim and scan scholarly literature and electronic sources, including audio-visual contents;                  - plan, prepare and deliver oral presentations related to the fields of medicine and dental medicine;                  - ask questions about personal data and symptoms, and give basic instructions when interacting with patients;                  - communicate with colleagues about a range of topics related to medicine and dental medicine.</p>					
<p><b>Contents of the course:</b>                  The implications of learning English as a lingua franca for medical professions; basic word structure of medical/dental terms; terminology related to the human body and body systems (musculoskeletal, cardiovascular, respiratory, digestive, and endocrine); medical education (general (dental) practitioners and specialists); medical equipment; basic chairside instruments; human dentition; prevention; introduction to dentist-patient communication; taking a history; most common oral diseases and conditions; most common ethical issues in dental medicine.</p>

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>1E1</b>	
<b>Level of studies: Second</b>				
<b>Course: English for Academic Purposes</b>				
<b>Professor in charge (Name, middle letter, surname): Irena V. Aleksić-Hajduković</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 2</b>			<b>Year of the study: I / 1<sup>st</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years): /</b>			<b>Course code: I_1_01</b>	
<b>Objectives of the course:</b> Enabling the students interested in scientific research to communicate in an academic environment and deliver oral and poster presentations at international (student) conferences. The students will also gain theoretical and practical knowledge of the structure of research papers and different modes that take part in meaning-making processes in order to create multimodal digital contents in the English language and present their research findings in an efficient manner.				
<b>Outcomes of the course:</b> After completing this course, the student should be able to: <ul style="list-style-type: none"> <li>- communicate in the global academic environment and fulfill academic tasks in the English language, which is in accordance with the internationalisation of Higher Education institutions and student mobility programs;</li> <li>- understand and apply the theoretical frameworks and conventions of the academic discourse</li> <li>- adhere to the lexical and syntactic features of the English language and create multimodal contents to complement digital presentations of their own research findings;</li> <li>- critically and analytically read professional and scientific publications related to medicine and dental medicine;</li> <li>- skim and scan relevant literature and attend international conferences in order to keep up to date with the innovations in the field, which is in accordance with the notion of lifelong learning;</li> <li>- understand how to cite references and avoid plagiarism.</li> </ul>				
<b>Contents of the course:</b> The global academic community recognises the English language as a <i>lingua franca</i> . Therefore, this course will provide the students with the fundamental conventions of the academic discourse and academic genres relevant for writing abstracts and research articles in English. The course will also include: lexical and syntactic features of the academic discourse; cohesion; critical and analytical reading; argumentation in speaking and writing; referencing styles; anti-plagiarism; various modes that contribute to meaning-making processes.

<b>Entry requirements:</b>		<b>Course code: I_1_03</b>		
<b>Objectives of the course:</b> The objective of the course is to enable students to acquire additional knowledge of the histological structure of cells, tissues and organs of the orofacial system, their origin and developmental processes, regenerative and reparative potential, including the changes related to aging.				
<b>Outcomes of the course</b> 1. Students acquire detailed knowledge of the structure, origin and development of orofacial tissues and organs. 2. The acquired knowledge is the basis for further study; it prepares the students for understanding the physiological, pathophysiological, and pathological changes in this region, as well as the biological basis of various therapeutic procedures.				
<b>Contents of the course</b> The skeleton of neurocranium and viscerocranium: histological structure, specificities and developmental processes. Masticatory muscles: histological structure and development, proprioceptive sensibility. Cranial nerves: histological structure, development, specificities. Oral mucosa: a dynamic barrier between the external environment and deeper tissues. Epithelial homeostasis: mechanisms for maintaining the integrity of the oral epithelium. Somatosensory innervation of oral mucosa. Glands of the oral cavity: histological structure and development. Mineralized tissues: histological structure and development. Protective reactions of dental pulp: role of odontoblasts. Protective mechanisms in a healthy periodontium. Temporomandibular joint: histological structure and development. Regeneration, repair and remodeling of orofacial tissues. Changes in oral tissues related to aging.

<b>Objectives of the course:</b> Expanding the knowledge of the principles of the organization of the cells, tissues and organs of the nervous system, as well as familiarizing students with the basics of their embryonic development.			
<b>Outcomes of the course:</b> After completing the course, the student should be able to: <ul style="list-style-type: none"> <li>- Explain the basic principles of embryonic development and organization of the human nervous system</li> <li>- Notice the interconnection of the structure and the function of the organs of the nervous system</li> <li>- Describe the linkage of nervous tissue to other tissues and organs of the human body</li> <li>- Apply acquired knowledge in further study, primarily in mastering the material in physiology and pathology.</li> </ul>			
<b>Content of the course:</b> Neurohistological techniques and neurohistological preparations. General characteristics of the structural organization of neural tissue. The way of organizing neural tissue in organs and organ systems. Histological features of the central and peripheral nervous system. Ultrastructural characteristics of the nerve cells. The basic rules of connection of neural structures with their function and function disorders. General characteristics of embryological development of the nervous system. Special features of morphogenesis of nervous system organs.

<b>Course Leader (Name, middle letter, surname): Sanja M. Milutinović-Smiljanić</b>			
<b>Course status (compulsory/elective): Elective</b>			
<b>ECTS: 2</b>		<b>Year of study: I / 2<sup>nd</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years): /</b>		<b>Course code: I_1_05</b>	
<b>Objectives of the course:</b> Expanding the student's knowledge of general principles of human development. Introducing students to the developmental characteristics of individual organs and organ systems. Acquiring knowledge of the mechanisms and forms of disorders of embryonic development of tissues and organs, including the influence of major teratogenic factors on development.			
<b>Outcomes of the course:</b> After completing the course, the student should be able to: <ul style="list-style-type: none"> <li>- Describe and recognize the causes, mechanisms and developmental disorders of certain tissues and organs, which will facilitate the understanding of oral manifestations of various syndromes</li> <li>- Recognize and explain the causes of malformations and associated diseases in children and adults which are the subjects of learning in clinical classes.</li> </ul>			
<b>Content of the course:</b> General characteristics of tissue and organ development. Developmental disorders in the pre-embryonic, embryonic and fetal periods. Teratogenic types and their impact on the development. Prenatal diagnostics. Disorders of the musculoskeletal, cardiovascular, nervous, lymphatic, endocrine, respiratory, digestive and urinary systems. Developmental disorders of the face and pharyngeal systems. Developmental abnormalities of the senses and skin.			
<b>Recommended literature:</b> Sadler T.W. Langman's Medical Embryology. 14 <sup>th</sup> Ed. Wolters Kluwer, The Netherlands. 2018. Pp. 1-456.			
<b>Total number of classes in active learning:</b>			Professional practice / independent work:
Lectures: 30	Practicals:	Other modes of teaching : 30	
<b>Teaching and learning methods:</b> Interactive learning, seminars.			
<b>Assessment (maximum number of points 100)</b>			
<b>Pre-exam compulsory activities</b>	<b>Total 40 points</b>	<b>Final exam 60 points</b>	
Seminars	20	Written defense of a project on a chosen topic	60

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>1E6</b>
<b>Level of studies: Second</b>				
<b>Course: Biology of Stem Cells</b>				
<b>Course Leader (Name, middle letter, surname): Jelena M Milašin</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 2</b>		<b>Year of the study: I / 2<sup>nd</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_1_06</b>		
<b>Objectives of the course:</b> Gaining the knowledge of stem cells, their origin, properties and renewal capacity, with particular emphasis on stem cells originating from tissues of the orofacial region.				
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: -Understand the complex notion of stem cells -Explain the principles of self-renewal and differentiation of stem cells -Describe various types of stem cells and recognize the differences between them, depending on their origin -Understand the importance of stem cells in regenerative medicine and dentistry				
<b>Contents of the course:</b> The student will be acquainted with the definition, types and classification of stem cells, their characteristics, basic functions and mechanisms of their regulation, main methods of stem cell isolation and establishment of primary cultures, advantages and disadvantages of different isolation methods; the student will also be acquainted with various methods of stem cell characterization and detection of changes occurring in the process of differentiation. In addition, the student will gain knowledge on the benefits and risks of stem cell therapy, as well as the current achievements in this field. Finally, a thorough insight into the perspective of stem cell administration in the treatment of orofacial diseases will be provided.

<b>Study program: Integrated Studies of Dental Medicine</b>			1E7
<b>Level of studies: second</b>			
<b>Mutagen Effects of Environmental Factors from Food, Water and Air</b>			
<b>Course Leader (Name, middle letter, surname): Marko K. Babic</b>			
<b>Course status (compulsory/elective): Elective</b>			
<b>ECTS: 2</b>		<b>Year of the study: I / 2<sup>nd</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_1_07</b>	
<p><b>Objectives of the course:</b>          Gaining knowledge about different agents present in food, water and air which pollute the environment. Studying their harmful effects at the level of: organisms, cell and genome. Mutagen effects of polluting agents on genes involved in controlling cell cycle and their ability to transform normal cells into malignant. Origin of polluting agents possessing mutagenic characteristics and their relation to the degree of industrial development of the country.          Protection against the harmful influence of polluting agents on humans and treatment of the people affected by these agents.</p>			
<p><b>Outcomes of the course:</b>          -Students should recognize different harmful agents which could be taken in through food, water and by breathing in the polluted air          -Students will acquire the knowledge of the effects of polluting agents at the level of organism and at the cellular level          -Students will gain knowledge of different cytological and molecular genetics techniques used for evaluating the degree of harmful genotoxic effects</p>			
<p><b>Contents of the course:</b> Presence of aflatoxin in milk and its cancerogenic effect. Using nitrites for food conservation and their mutagenic influence on the genome. Harmful effects of air polluting agents: pm-2.5 and pm-10, aryl carbohydrates produced by motor vehicles. Toxic compounds in tobacco's smoke. Harmful effects of heavy metals from water. Evaluation of the degree of mutagenic effects of polluting agents by using the Comet test.          Applying protection measures in order to prevent mutagenic effects of polluting agents in humans.</p>

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>1E9</b>	
<b>Level of studies: Second</b>					
<b>Course: Information Technologies in Dentistry</b>					
<b>Course Leader (Name, middle letter, surname): Milicic R Biljana</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 2</b>		<b>Year of the study: I / 1<sup>st</sup> semester</b>			
<b>Entry requirements (passed exams from the previous years): /</b>		<b>Course code: I_1_09</b>			
<b>Objectives of the course:</b> Acquisition of functional IT (information technologies) literacy required in the learning process during the studies, as well as its subsequent application in the professional work of future dentists. During the course, students acquire the knowledge and skills necessary for continuous learning, modern communication and presentation of their work throughout their professional careers.					
<b>Outcomes of the course:</b> After completing the class and passing the exam, the student should: <ul style="list-style-type: none"> <li>- Properly use modern information and communication technologies in the learning process in all dental disciplines, during and after graduation.</li> <li>- Use commonly used software packages as part of general computer literacy: Word, Excel, Power Point.</li> <li>- Adequately process photos.</li> <li>- Select the right sources of information.</li> <li>- Use various search methods and sources for searching medical information on the Internet and online databases.</li> <li>- Use software tools to process information.</li> </ul>					
<b>Contents of the course:</b> Information in dentistry, the strategy of searching for information in dentistry on the Internet. Presentation skills of the acquired information in dentistry. Practical work and use of software packages as part of general computer literacy, as well as software packages for storing the collected information. Oral presentation with the help of PowerPoint.

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>1E10</b>	
<b>Level of studies: Second</b>				
<b>Course: Basics of Biomechanics in Dentistry</b>				
<b>Course Leader (Name, middle letter, surname): Đorđe I Stratimirović</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 2</b>		<b>Year of the study: I / 2<sup>nd</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_1_10</b>		
<p><b>Objectives of the course:</b>          Gaining knowledge of mechanics and biomechanics required to understand the various branches of clinical dentistry. In-depth knowledge of mechanical concepts, sizes and models in solid and soft bodies and fluids. The emphasis is placed on the mechanical properties that are important for biological structures and processes that take place in biological systems. Developing skills for qualitative and quantitative approach for analyzing biomechanical problems.</p>				
<p><b>Outcomes of the course:</b>          After completing the course and passing the exam, the student should be able to:</p> <ul style="list-style-type: none"> <li>- describe the basic concepts and models of mechanics</li> <li>- differentiate between scalar and vector quantities</li> <li>- understand and explain the basic quantities of rigid body mechanics</li> <li>- understand the concept of leverage and solve simple problems</li> <li>- describe the concepts and quantities of deformable body mechanics</li> <li>- recognize and understand the basic equations of fluid mechanics.</li> </ul>				
<p><b>Contents of the course:</b>          Basic concepts and quantities of mechanics. Scalar and vector quantities. Point particle model, translational motion and Newton's laws, rigid body model, rotational motion and torque. Statics and equilibrium conditions. Levers and body parts as levers. Mechanics of deformation: stress, deformation, modulus of elasticity, strength, toughness, brittleness and stiffness of the material. Fluid mechanics, basic equations, viscosity. Laminar and turbulent flow.</p>

<p><b>Objectives of the course:</b> This course will provide students with the theoretical knowledge of the main histological techniques. The acquisition of theoretical knowledge of the basic techniques applied in histology. The acquired knowledge will contribute to a better understanding of morphological sciences, particularly histology and embryology.</p>			
<p><b>Outcomes of the course:</b>                  After completing the course, the student should be able to:</p> <ul style="list-style-type: none"> <li>- Recognize and describe the types of microscopy</li> <li>- Describe tissue handling and sectioning for microscopy</li> <li>- Demonstrate knowledge of tissue staining techniques using different types of stain according to the tissue type</li> <li>- Describe and interpret histological images.</li> </ul>			
<p><b>Content of the course:</b> History of the microscope. Microscope types. Solid and soft tissue preparation methods. Tissue processing for light microscopy. Routine staining of histological preparations. Special staining methods. Tissue processing for electron microscopy. Histochemistry. Immunohistochemistry. Autoradiography. Interpretation of histological preparations.</p>

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>1E17</b>	
<b>Level of studies: Second</b>				
<b>Course: Gene Therapy-Principles and Practice</b>				
<b>Course Leader (Name, middle letter, surname): Jelena M Milašin</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 2</b>		<b>Year of the study: I / 2<sup>nd</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_1_17</b>		
<p><b>Objectives of the course:</b>          Acquiring knowledge about the basic concepts and principles of gene therapy as one of the methods of the future when it comes to the treatment of human hereditary diseases, the approaches used for replacing defective genes with normal ones, i.e. methods of transferring exogenous nucleic acids to altered cells, the promises and the limitations of gene therapy.</p>				
<p><b>Outcomes of the course:</b>          After completing the course and passing the exam, the student should be able to:</p> <ul style="list-style-type: none"> <li>- Explain the essence of gene therapy</li> <li>- Understand the main mechanisms of action of the "therapeutic gene" in cells with defective genetic material</li> <li>- Describe the various methods of exogenous nucleic acids transfer into cells and tissues of a person with a genetic disease</li> <li>- Understand the advantages and disadvantages of gene therapy</li> <li>- Consider the possibility of gene therapy application in the treatment of diseases of the maxillofacial region</li> </ul>				
<p><b>Contents of the course:</b>          The student will be acquainted with the definition of gene therapy, criteria for selection of diseases suitable for treatment with gene therapy, gene therapy strategies, <i>in vivo</i> and <i>ex vivo</i> transfer of genetic material and basic principles of gene transfer, the main methods of viral and non-viral nucleic acid insertion into diseased cells, the advantages and disadvantages of both forms of gene transfer. The student will also become familiar with the risks of this type of therapy as well as the currently greatest achievements in the field. Finally, the student will learn about the prospects of applying gene therapy in the treatment of various diseases of the maxillofacial region, from large bone defects to oral cancer.</p>

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>1E18</b>	
<b>Level of studies: Second</b>					
<b>Course: Genetic Basis of Common Human Diseases</b>					
<b>Course Leader (Name, middle letter, surname): Branka M. Popovic</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 2</b>			<b>Year of the study: I / 2<sup>nd</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_1_18</b>		
<b>Objectives of the course:</b> Acquiring knowledge about the role of specific hereditary and environmental factors in determining the phenotype of multifactorial traits.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: <ul style="list-style-type: none"> <li>- describe the types of genetic markers that could be related with a certain diseases</li> <li>- explain the significance of environmental factors in modifying the phenotype of multifactorial traits</li> <li>- describe the mechanisms for determining genetic susceptibility to the most common diseases</li> <li>- relate etiological factors with an increased risk for appearance of common human diseases</li> <li>- explain the importance of detecting genetic and environmental factors at an early stage in order to reduce the risk of disease</li> </ul>					
<b>Contents of the course:</b> Genetic susceptibility to common diseases; the types and mechanisms of genetic susceptibility; approaches to proving genetic susceptibility - the liability/threshold model; types of multifactorial inheritance; determining the influence of etiological factors in ordering the multifactorial disorders; disease models for multifactorial inheritance - identification of risk factors for <i>diabetes melitus</i> ; identification of risk factors for cardiovascular diseases; identification of risk factors for neurodegenerative diseases.

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>1E19</b>	
<b>Level of studies: second</b>				
<b>Course: Viral Oncogenesis</b>				
<b>Course Leader (Name, middle letter, surname): Marko K. Babic</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 2</b>		<b>Year of the study: I / 2<sup>nd</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_1_19</b>		
<p><b>Objectives of the course:</b> Introducing students to different types of DNA and RNA viruses that have the ability to transform normal cells into malignant. Distinguishing the ways of their transmission and gaining insights into their life cycle in the infected cells. Analyzing the possible effects of viral genome insertion into human DNA and different molecular mechanisms by which uncontrolled proliferation of infected cells is induced. Association between some infectious diseases caused by viruses and tumor origin. Treatment of diseased patients and prevention of malignant transformation.</p>				
<p><b>Outcomes of the course:</b>                  At the end of the course, the student:                  - should recognize diseases caused by viruses possessing oncogenetic potential.                  - acquire knowledge of the molecular mechanisms by which DNA and RNA viruses transform normal cells into malignant cells</p>				
<p><b>Contents of the course:</b>                  Characteristics of DNA and RNA viruses influencing different types of tumors. Replication of nucleic acid in DNA and RNA viruses. Insertion of viral genome in the DNA of human cells. Distinguishing mechanisms by which viral insertion alters the activity of the genes involved in the controlling cell cycle. Specificities and therapy of tumors caused by viruses.</p>

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>1E20</b>	
<b>Level of studies: Second</b>					
<b>Course: Biochemical Characteristics of the Oral Pellicle</b>					
<b>Course Leader (Name, middle letter, surname): Ivan S. Dožić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 2</b>			<b>Year of the study: I / 2<sup>nd</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_1_20</b>		
<p><b>Objectives of the course:</b>                  Students will acquire a basic knowledge of the biochemical composition of the oral pellicle, adsorption mechanisms of specific salivary biomolecules and proteins on oral tissues, and understand the functions of the mucosal and dental pellicles.</p>					
<p><b>Outcomes of the course:</b>                  After completing this course the student should demonstrate knowledge and understanding of:</p> <ul style="list-style-type: none"> <li>- the biochemical composition of the tooth pellicle</li> <li>- adsorption mechanisms of proteins, glycoproteins, lipids, carbohydrates from saliva on the surface of tooth enamel</li> <li>- the biochemical composition of the mucosal pellicle</li> <li>- adsorption of saliva glycoproteins (mucin) on the oral mucosa</li> <li>- the interaction of salivary mucins with other biomolecules and the formation of heterotypic complexes in the oral mucosa</li> <li>- the protective role of the pellicle in the oral cavity</li> </ul>					
<p><b>Contents of the course:</b>                  The definition of the acquired pellicle in the oral cavity; the biochemical composition of the tooth pellicle; ionic interactions between saliva biomolecules and the surface of the tooth enamel; the formation of interconnections between organic molecules; the role of enzymes in pellicle composition; the biochemical composition of the mucosal pellicle; indirect and direct interactions of salivary mucins with epithelial cells of the oral mucosa; the interaction of salivary mucins with other biomolecules; the functions of dental and mucosal pellicles.</p>

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>1E21</b>	
<b>Level of studies: Second</b>				
<b>Course: Ergonomy in Dentistry</b>				
<b>Course Leader (Name, middle letter, surname): Srđan D Poštić</b>				
<b>Course status (compulsory/elective):</b> Elective				
<b>ECTS: 2</b>		<b>Year of the study: I / 1<sup>st</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_1_21</b>		
<b>Objectives of the course:</b> Introducing students to the organization of work and the layout of work items, equipment and materials in the dental office from an ergonomic point of view.				
<b>Outcomes of the course:</b> After completing the course, the student is trained to rationally use the work space in the dental office.				
<b>Contents of the course:</b> Definition and importance of ergonomics in dentistry; general ergonomic factors and principles in the work environment - temperature, pressure, humidity, noise, vibration; concepts of ergonomic landscaping in the dental office; ergonomics of the work of the dentist-dentist in the dental office; ergonomic forms - design of therapeutic chairs; concepts of ergonomic arrangement of the work space in the wider and narrower environment of the dental office; concepts of ergonomic approach in group work with support staff - with a dental nurse and with a dental technician; anatomical and physiological aspects of the proper working position of the therapist, patient and nurse; design of dental equipment and work instruments and impact on the locomotor system; ergonomics in transportation of work to the dental office; occupational diseases and an ergonomic approach to preventing occupational diseases; ergonomics in the selection and use of dental materials.

<b>Study Programme: Integrated Studies of Dental Medicine</b>				<b>C7</b>
<b>Level of studies: Second</b>				
<b>Course: General and Oral Pathology</b>				
<b>Course Leader (Name, middle letter, surname): Tepavčević B. Zvezdana</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 10</b>		<b>Year of the study: II / 3<sup>rd</sup> and 4<sup>th</sup> semesters</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: ST20PATO</b>		
<b>Objectives of the course:</b> To gain the knowledge of morphological changes, i.e. of the structural damage to cells, tissues and organs and enable students to relate them to the causes, mechanisms, and consequences of their development, which is an important prerequisite for understanding the essence of pathological processes and, consequently, human diseases.				
<b>Outcomes of the course:</b> After successfully completing the course, the student should: <ul style="list-style-type: none"> <li>- Demonstrate knowledge and understanding of basic pathological processes related to adaptive, vascular and inflammatory responses in the body</li> <li>- Demonstrate the knowledge and competence required for relating significant pathological conditions and the impact of dental interventions on them (endocarditis, myocarditis, diabetes, hepatitis)</li> <li>- Demonstrate knowledge and understanding of the underlying pathological processes in the oral cavity</li> <li>- Demonstrate the knowledge and competence required for recognizing and diagnose oral cystic changes</li> <li>- Possess knowledge and understand the essence of pathological processes underlying human diseases, particularly those affecting the oral cavity</li> <li>- Have the knowledge and competence required for attending and mastering all clinical subjects.</li> </ul>				
<b>Contents of the course:</b> Introduction to Pathology (definition, importance, methods). Adaptive reactions. Changes in the structure of tissues and cells. Damage and death of cells. Necrosis and apoptosis. Disturbances of metabolism of pigments. Disturbances in body liquid contents. Disturbances in blood circulation. Inflammation. Regeneration processes. Neoplasma – tumors. Cardiovascular system. Respiratory system. Diseases of the digestive system Diseases of the urinary system. Diseases of the endocrine system. Disease of the central nervous system. Introduction to Oral pathology. Cysts of the orofacial region. Diseases of salivary glands. Odontogenic tumors. Disease of haematopoetic apparatus. Diseases of bones and joints. Diseases of skin and oral mucosa.

<b>Course Leader (Name, middle letter, surname): Zoran T. Mandinić</b> Zoran R. Vulicevic, Mirjana D. Ivanovic, Dejan Lj. Markovic, Vanja V. Petrovic, Jelena C. Mandic, Olivera M. Jovicic, Ivana S. Radovic, Tamara O. Peric, Zoran T. Mandinic				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 9</b>		<b>Year of the study: II / 3<sup>rd</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years): /</b>		<b>Course code: ST20PREV</b>		
<b>Objectives of the course:</b> To enable the students to acquire new knowledge in the field of etiopathogenesis, prevention and prophylaxis of oral diseases, as well as promotion of oral health, and the role and responsibilities of the dentist in the oral health of an individual and the community.				
<b>Outcomes of the course:</b> After completing this course, the student should: Know the etiology of oral diseases, Know the risk factors for the onset and the ability to diagnose oral diseases, Provide advice on controlling the risk factors for oral diseases, analyze the diet and provide advice on the maintenance of oral health, Know and apply the methodology of communication, motivation and teaching in dental health education work, Know and implement methods of prophylaxis by applying modern means for remineralization of hard dental tissues, Know the methods of minimally invasive karyology, Know and apply prophylactic methods in the prevention of periodontal diseases (practices the techniques of professional removal of soft deposits and supragingival concurrences), Know and apply methods of dental caries prophylaxis (fissures sealant, topical application of highly concentrated fluorides, chemoprophylaxis), Know and implement prophylactic measures in restorative dentistry to ensure the preservation of oral health and the durability of dental reimbursements for high-risk patients with fixed orthodontic appliances, restorations, fixed prosthetic restorations and implants, Know the principles of prevention of oral diseases of persons with special needs, medical risks, and patients with rare diseases, Know the principles of keeping medical records, Be able to monitor epidemiological indicators of oral diseases.				
<b>Contents of the course:</b> A modern understanding of dental caries; Saliva and oral health; Prevention of early childhood caries; Diet and oral health; Contemporary concept of remineralization of hard dental tissues: fluorides, casein-phosphopeptide, xylitol, ozone; Prophylactic measures in the prevention of mouth and tooth diseases (plaque detection, removal of soft deposits, removal of tartar, local application of fluoride, fissures sealant); Etiology and prevention of periodontal disease and soft tissues of the oral cavity; Etiology and prevention of orofacial region injury; Etiology and prevention of orthodontic malformations; Diagnosis of caries risk; Prevention of oral diseases of patients with special needs, medical risk and patients with rare diseases; Prophylaxis of oral diseases in patients with special needs, medical risks, and patients with rare diseases; The social medical significance of oral diseases; Oral health promotion; Health education.

<b>Study Programme: Integrated Studies of Dental Medicine</b>				<b>C9</b>
<b>Level of studies: Second</b>				
<b>Course: Microbiology and Immunology</b>				
<b>Course Leader (Name, middle letter, surname): Dušan B. Pavlica, Milena Ž. Radunović</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 9</b>		<b>Year of the study: II / 3<sup>rd</sup> semester</b>		
<b>Entry requirements: /</b>		<b>Course code: ST20MIKR</b>		
<b>Objectives of the course:</b> To familiarize students with the most common pathogens, their mechanisms of activity, as well as their identification using standard and contemporary methods of laboratory diagnostics.				
<b>Outcomes of the course:</b> After completing the course, students gain a basic knowledge of medical microbiology and immunology. They should understand the principles of microscopy, cultural and serological diagnostics of different human pathogens. Also, the students should get acquainted with the oral biotope and the microbiological mechanisms of developing diseases of dental tissue and periodontium.				
<b>Contents of the course:</b> Basics of bacterial cell structure, virulence factors, mechanisms of development of infectious diseases, prevention of infections (sterilization and disinfection), antibiotics and their mechanism of action. Structure of the immune system, innate and acquired immunity (T and B lymphocytes), activity of the complement system and cytokines. Autoimmune diseases and their mechanisms, hypersensitivity reactions, vaccines and immune serums Most common human bacterial pathogens ( <i>Staphylococcus</i> , <i>Neisseriae</i> , <i>Streptococcus</i> , <i>Streptococcus pneumoniae</i> , <i>Enterococcus</i> , <i>Bordatella</i> , <i>Bacillus anthracis</i> , <i>Corynebacterium diphtheriae</i> , <i>Haemophilus influenzae</i> , <i>Legionella</i> , <i>Clostridium</i> ( <i>Cl. tetani</i> , <i>Cl botulinum</i> , <i>Cl gas gangrenae</i> ), <i>Listeria</i> , <i>Brucella</i> , <i>Mycobacterium</i> , <i>Enterobacteriaceae</i> , <i>Vibrio</i> , <i>Helicobacter</i> , <i>Campylobacter</i> , <i>Traponema pallidum</i> , <i>Borelliaburgdorferi</i> , <i>R. prowazeki</i> , <i>Chlamidiae</i> ) Most common human viral pathogens (HSV1, HSV2, VZV, CMV, EBV, HHV6, HHV7, HHV8, <i>Orthomyxoviridae</i> , <i>Rhabdoviridae</i> , <i>Poxviridae</i> , <i>Togaviridae</i> , <i>Paramyxoviridae</i> , hepatotropic viruses, HIV, prions) Basic characteristics of the oral biotope. Most important members of the oral flora (oral streptococci, <i>Lactobacillus</i> , <i>Actinomyces</i> , <i>Porphyromonas</i> , <i>Prevotella</i> , <i>Fusobacterium</i> , <i>Oralnespirochete</i> , <i>A. actinomycetemcomitans</i> , filamentous bacteria, oral protozoa and the most important fungi). Microbiological aspects of the dental plaque structure, etiopathogenesis of caries and periodontitis.

<b>Study Programme: Integrated Studies of Dental Medicine</b>				<b>C10</b>	
<b>Level of studies: Second</b>					
<b>Course: Dental Anatomy with the Fundamentals of Gnathology</b>					
<b>Course Leader (Name, middle letter, surname): Rade S. Živković</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 8</b>			<b>Year of the study: II / 3<sup>rd</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20DEAN</b>		
<b>Objectives of the course:</b> Studying the anatomy of permanent teeth and getting acquainted with the basics of gnathology.					
<b>Outcomes of the course:</b> After successfully completing the course, the student: - has been trained to recognize permanent teeth; - is able to perform wax sculpting of the teeth of the permanent dentition; - has acquired the basic knowledge of gnathology related to the anatomy and physiology of the orofacial system; - has acquired the basic knowledge of the articulation and has been trained to use the mean dental articulator.					
<b>Contents of the course:</b> Lectures : Introduction to morphology. Orofacial system. General knowledge of teeth. Definition, classification and function of the tooth. Dental formula. Periods of dentition. Chronology of tooth emergence. Dental nomenclature. Topographic-anatomical signs on the teeth. General oral and dental anatomy. Anatomical parts and structure of the teeth of the human population, class of permanent incisors, canines, premolars and molars in the lower and upper jaw. Introduction to gnathology, concept, definition and subject of study. Temporomandibular joint - anatomy and function. Muscles of the orofacial system, functional specifics of the masticatory muscles. Physiological regulation of lower jaw movements. Physiologically optimal occlusion and non-physiological occlusion. Practicals: Wax sculpting the teeth of permanent dentition; Methods of recording lower jaw movements. Posterior (articular) guidance and anterior (occlusal) guidance. Lower jaw reference positions, intercuspal position, physiological rest position, central relation. Using a facebow to transfer models into articulators. Simulation of lower jaw movements. Model based occlusal analysis in central and eccentric positions, Occlusal wax up according to Peter Thomas.

<b>Study Programme: Integrated Studies of Dental Medicine</b>				<b>C11</b>	
<b>Level of studies: Second</b>					
<b>Course: Public Health</b>					
<b>Course Leader (Name, middle letter, surname): Svetlana B. Jovanović</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 5</b>				<b>Year of the study: II / 4<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>				<b>Course code: ST20JAZD</b>	
<b>Objectives of the course:</b> To enable the student to gain knowledge in the field of public health and to master the skills of planning and implementing prevention measures related to the general and oral health of the population. The student also acquires knowledge of the basics of epidemiology and the measurements of quality of life in relation to general and oral health.					
<b>Outcomes of the course:</b> After successfully completing the course, the student should be able to: <ul style="list-style-type: none"> <li>- Relate public health to dental science</li> <li>- List risk factors for oral and dental diseases and participate in oral health research</li> <li>- Implement programs, strategies, campaigns and other community actions in the prevention of oral and chronic non-communicable diseases</li> <li>- Describe the measures to prevent intrahospital infections and epidemics of infectious diseases</li> <li>- Participate in dental health education programs</li> <li>- Understand the types of epidemiological studies</li> <li>- Carry out quality of life measurements in relation to oral health</li> </ul>					
<b>Contents of the course:</b> Introduction, definition, development and importance of public health and dental public health; exposure and dispositional risk factors contributing to the disease; prevention of health disorders; organization of health care by levels; measuring the general and oral health of the population using indicators; prevention measures for the preservation and promotion of general and oral health; demonstration of epidemiological research and conclusion of infectious and non-communicable diseases, planning of epidemic measures; infectious disease prevention measures; general and specific prevention measures; socio-medical diseases; assessment and measurement of quality of life in terms of general and oral health.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>2E1</b>	
<b>Level of studies: Second</b>					
<b>Course: Oral Hygiene Products</b>					
<b>Course Leader (Name, middle letter, surname): Zoran T. Mandinić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 2</b>			<b>Year of the study: II / 4<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):/</b>			<b>Course code: I_2_01</b>		
<b>Objectives of the course:</b> To introduce students to the types and techniques of oral hygiene maintenance.					
<b>Outcomes of the course:</b> After completing the course, the student should: -Understand the importance and role of oral hygiene in maintaining oral and general health -Identify oral hygiene products -Know various techniques of tooth brushing -Explain to the patient the purpose and importance of regular oral hygiene and demonstrate how it is practically performed (demonstration of tooth-brushing techniques) -Recommend appropriate toothpaste to the patient and explain the effect of fluoridated toothpaste in caries prevention -Motivate the child, parents and patients to maintain oral hygiene regularly and properly					
<b>Content of the course:</b> Importance of maintaining oral hygiene; basic conditions for maintaining oral hygiene in the prevention of oral diseases; basic oral hygiene products; oral hygiene aids; techniques for performing oral hygiene; training methodology in oral hygiene maintenance; recommendations for the preservation of hard and soft tissues of the mouth by applying oral hygiene products.

<b>Study program: Integrated Studies of Dental Medicine</b>		<b>2E3</b>	
<b>Level of studies: Second</b>			
<b>Course: Bone Tissue Physiology</b>			
<b>Course Leader (Name, middle letter, surname): Gavriilo B. Brajović</b>			
<b>Course status (compulsory/elective): Elective</b>			
<b>ECTS: 2</b>		<b>Year of the study: II / 4<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_2_03</b>	
<b>Objectives of the course:</b> Acquiring knowledge about complex physiological processes that take place in bone tissue, the mechanisms and factors involved in their development and the influence of various endogenous and exogenous factors, with particular emphasis on the physiological processes that occur in alveolar bone.			
<b>Outcomes of the course:</b> After completing the course and passing the exam, students should have the knowledge that enables them to: <ul style="list-style-type: none"> <li>- List and explain the physiological roles of bone tissue in the body</li> <li>- Describe the morphological and physiological characteristics of bone tissue</li> <li>- Explain the complex physiological mechanisms involved in bone tissue formation and degradation, as well as the regulatory factors involved in these processes</li> <li>- Explain the physiological mechanisms involved in the bone remodeling process, as well as the significance of that process</li> <li>- Describe the influence of endogenous and exogenous factors on the process of bone tissue remodeling</li> <li>- Explain the specifics of the physiology of the alveolar bone</li> </ul>			
<b>Contents of the course:</b> Basic morphological characteristics of bone tissue, physiological characteristics of bone cells and properties of extracellular matrix, processes of bone tissue formation and degradation, bone remodeling, influence of endocrine, paracrine and autocrine factors on processes of bone degradation and formation, influence of exogenous factors on remodeling of bone, factors affecting the remodeling of the alveolar jaw bone.

<b>Course: Laboratory Diagnostics of Tumors in the Orofacial Region</b>					
<b>Course Leader (Name, middle letter, surname): Zvezdana Tepavčević</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 2</b>			<b>Year of the study: II / 4<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_2_04</b>		
<b>Objectives of the course:</b> The objective of the course is to provide students with a knowledge of the basics of pathohistological diagnostics, and significant correlations between clinical and pathohistological findings.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: - Distinguish different types of tumors in the orofacial region - Demonstrate knowledge of the epidemiological and pathohistological parameters of oropharyngeal cancers - Explain the methods for standard tissue processing, tissue fixation techniques, tissue molding and cutting - List and explain classic and special dyeing techniques					
<b>Contents of the course:</b> -Basics of oral pathology, the importance of incidence of oropharyngeal tumors in dentistry; the importance of the correlations between epidemiological, pathohistological and clinical parameters in accurate and timely diagnosis; -standard tissue processing and laboratory techniques for tissue fixation, molding and cutting, and staining tissue using basic hematoxylin-eosin staining; -special staining methods necessary for the diagnosis of certain types of oropharyngeal cancers.

<b>Course Leader (Name, middle letter, surname): Branko S. Dožić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 2</b>			<b>Year of the study: II / 4<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_2_05</b>		
<b>Objectives of the course:</b> To introduce students to the significance of tumor markers and their role in the diagnosis; to learn how to assess the stage of disease, predict the course of the disease, plan and monitor the therapeutic effect.					
<b>Outcomes of the course:</b> After completing the course, the student should: - be informed about the application of tumor markers in the diagnosis - be informed about the application of tumor markers in clinical practice, and their reliability - be able to interpret the results of tumor marker analysis and their impact on the therapy planning and tracking the therapeutic effects					
<b>Contents of the course:</b> Basic characteristics, formation and classification of tumor markers. Diagnostic procedures for determining their value. Interpretation of the findings obtained by tumor marker analysis (positive and negative results) in clinical practice as a means for the early detection of malignancies; monitoring patients with malignant tumors (in terms of assessing the need for a surgical procedure) and estimating the applied therapy. The importance and types of tumor markers in the pathology of head and neck region.

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>2E9</b>
<b>Level of studies: second</b>			
<b>Course: Microbiological Aspects of Infection Control in Dentistry</b>			
<b>Course Leader (Name, middle letter, surname): Dušan B. Pavlica</b>			
<b>Course status (compulsory/elective): Elective</b>			
<b>ECTS: 2</b>		<b>Year of the study: II / 4<sup>th</sup> semester</b>	
<b>Entry requirements : passed exams from the previous years</b>		<b>Course code: I_2_09</b>	
<b>Objectives of the course:</b> Students will acquire knowledge of the most significant pathogens, the routes of microbial transmission in the dental practice, and infection-control methods used to prevent infections of the oropharyngeal and cervicofacial regions.			
<b>Outcomes of the course:</b> After completing this course the student should be able to: <ul style="list-style-type: none"> <li>- Identify the most significant infectious agents causing infections of the oropharyngeal and cervicofacial regions;</li> <li>- Identify the routes of microbial transmission in the dental practice;</li> <li>- Select and apply suitable physical and chemical agents to prevent cross-contamination.</li> </ul>			
<b>Content of the course:</b> Definitions of infection, (transient) bacteremia, and sepsis; the most significant bacterial, viral and fungal species causing infections relevant to dentistry; the role of microbiological laboratory in identifying infectious agents; principles and application of sepsis and antisepsis to prevent infections of the oropharyngeal and cervicofacial regions.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>2E10</b>	
<b>Level of studies: Second</b>					
<b>Course: Biofilm in Dentistry and Medicine</b>					
<b>Course Leader (Name, middle letter, surname): Milena Ž. Radunović</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 2</b>			<b>Year of the study: II / 4<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_2_10</b>		
<p><b>Objectives of the course:</b>                  Students will gain the knowledge of the formation of biofilm and its impact, including the difference between planktonic bacteria and biofilm-forming bacteria, the role of biofilm in persistence and antibiotic resistance, and how it can lead to the development of dental diseases (caries, gingivitis, periodontal disease) and diseases affecting other systems.</p>					
<p><b>Outcomes of the course:</b>                  After completing this course, the student should be able to:                  - demonstrate knowledge of the formation and structure of biofilm                  - understand the characteristics of microbial interactions within biofilm                  - understand the role of biofilm in the development of dental and other diseases</p>					
<p><b>Contents of the course:</b>                  The definition, developmental stages, and morphology of biofilm; characteristics of microbial interactions within biofilm; differences in the sensitivity of planktonic bacteria and biofilm-forming bacteria to antibiotics and chemicals; the role of biofilm in the development of caries (the formation of the acquired pellicle, acid production within biofilm); the role of biofilm in the development of gingivitis and periodontal disease (production of alkaline products, oxidation-reduction potential change); the role of biofilm in medicine (endocarditis, pneumonia, urinary infections, sepsis).</p>

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>2E14</b>
<b>Level of studies: second</b>			
<b>Course: Viral Infections in Dentistry</b>			
<b>Course Leader (Name, middle letter, surname): Dušan B. Pavlica</b>			
<b>Course status (compulsory/elective): Elective</b>			
<b>ECTS: 2</b>		<b>Year of the study: II / 4<sup>th</sup> semester</b>	
<b>Entry requirements : passed exams from the previous years</b>		<b>Course code: I_2_14</b>	
<b>Objectives of the course:</b> Students will acquire knowledge of different viruses that cause systemic and local infections relevant to dentistry (herpes viruses, Hepatitis B, C, and D, papilloma viruses, HIV), their laboratory diagnostics and interpretation of the results obtained. Additionally, students will acquire knowledge of specific and non-specific measures applied to prevent infections caused by these viruses.			
<b>Outcomes of the course:</b> After completing this course the student should be able to: <ul style="list-style-type: none"> <li>- Determine the transmission pathways of certain viruses causing infections relevant to dentistry</li> <li>- Interpret the results of laboratory diagnostics used to detect viral infections relevant to dentistry</li> <li>- Apply suitable specific and non-specific measures to prevent viral infections relevant to dentistry</li> </ul>			
<b>Content of the course:</b> Review of general characteristics of viruses. Review of direct and indirect laboratory diagnostic tools used to detect viruses. Fundamental features of herpes viruses, hepatotropic viruses relevant to dentistry (HBV, HCV, HDV), papilloma virus, HIV, and the infections caused by these viruses. Interpretation of the results of laboratory diagnostics used to detect viral infections.

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>2E15</b>	
<b>Level of studies: Second</b>				
<b>Course: Microbiological Diagnostics of Infections in the Oropharyngeal Region</b>				
<b>Course Leader (Name, middle letter, surname): Milena Ž. Radunović</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 2</b>		<b>Year of the study: II / 4<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_2_15</b>		
<b>Objectives of the course:</b> Students will gain knowledge of microbiological diagnostics of infections in the oropharyngeal region, including the advantages and limitations of certain diagnostic methods. These insights should enable students to provide proper interpretations of the results obtained in a microbiological laboratory.				
<b>Outcomes of the course:</b> After completing this course, the student should be able to: <ul style="list-style-type: none"> <li>- collect microbiological samples</li> <li>- complete the microbiology form and clearly indicate what the microbiologist should provide</li> <li>- understand the basic principles of diagnosing bacterial and viral infections</li> <li>- properly interpret the results of serological analyses</li> <li>- differentiate between various methods of determining antimicrobial resistance</li> <li>- interpret the results of antibiogram testing and select appropriate antibiotics</li> </ul>				
<b>Contents of the course:</b> Microbiology specimen collection and referring to laboratories for testing; microscope and microscopy; cultivation of bacteria on artificial media; identification of bacteria based on cultural, physiological, and biochemical characteristics; identification of bacteria based on antigenic properties using genome detection methods; determining antimicrobial resistance and interpreting the results of antibiogram testing; cultivation and identification of viruses in living cell systems; identification of viruses without cultivation; using serological diagnostic tests to detect viral diseases.

<b>ECTS: 8</b>			<b>Year of the study: III / 5<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20PAFI</b>	
<b>Objectives of the course:</b> Acquiring the knowledge of pathophysiological processes related to the etiology and pathogenesis of diseases studied in general medical and different dental disciplines.				
<b>Outcomes of the course:</b> After successfully completing the course, the student should be able to: <ul style="list-style-type: none"> <li>- Demonstrate knowledge of different types of etiological factors and their characteristics related to the pathological process, including the aspects of interactions with various structures of the organism;</li> <li>- Demonstrate knowledge and understanding of the mechanisms of the pathological process at the molecular level and its development, starting from biochemical, subcellular and cellular damage, through humoral and tissue disorders, disorders of various organs and organ systems leading to the manifestation of disease;</li> <li>- Interpret the pathogenesis of changes/disorders that give oral manifestations;</li> <li>- Describe the ways of adaptation and response of the diseased organism to the external environment;</li> <li>- Know the basic principles of functional testing of disorders of different organs and organ systems and independently analyze laboratory results.</li> </ul>				
<b>Contents of the course:</b> During the lectures and practicals students will be introduced with general and specific aspects of pathophysiology. In general part the focus will be directed toward understanding the role of different etiological agents in disease process and disturbance of specific and nonspecific immunity. In the specific part of the course the focus will be directed to etiopathogenesis of diseases of different human body systems with special attention to oral diseases and oral manifestations of them.

<b>Course Leader (Name, middle letter, surname): Ivica Z. Stančić</b>				
<b>Professors: Kosovka Obradović Đuričić, Ljiljana Tihaček Šojić, Aleksandar Todorović, Vojkan Lazić, Ivica Z. Stančić, Slobodan Dodić, Srđan Poštić, Rade Živković, Aleksandra Milić, Aleksandra Špadijer Gostović, Vesna Medić, Miodrag Šćepanović, Igor Đorđević</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 7</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20PRMP</b>	
<b>Objectives of the course:</b> To enable the students to gain a basic knowledge of the procedures of making complete, partial acrylic and partial skeletal dentures, as well as to be able to apply it in practical work during certain laboratory phases of making removable dental restorations.				
<b>Outcomes of the course:</b> After successfully completing the course, the student should be able to develop anatomical and diagnostic models. Create an individual tray and wax rims. Position the anterior and posterior teeth for total and partial dentures, and independently make wire clasps. Analyze models for studies in the parallelometer; plan the design of partial skeletal prosthesis for different classes of dentition. Possess knowledge of the laboratory stages of making removable partial denture. Flasking and deflasking procedures and all other laboratory procedures are well introduced and explained.				
<b>Contents of the course:</b> Impression materials in removable dental prosthetics. Building materials in the laboratory production of removable dental prosthetics; Preliminary impression: definition, selection of trays, materials and impression. Preparation of preliminary impression for casting. Exudation of a preliminary - anatomical model. Individual trays: types and workmanship. Definition and division of definitive impression. Creating a working model. Model Transfer to Articulator: Finding a Cinematic Rotation Center of condyles. Transferring the model of the upper edentulous jaw into a semi-adjustable articulator (procedure and possible errors). Transmission of the model of the lower edentulous jaw with the help of the register of the centric relation. Concepts of occlusion in the wearer of complete dentures. Bilateral balanced occlusion. Functional and physiognomic significance of anterior teeth. Choosing the size, shape and color of the front teeth for edentulous patients. The procedure for setting the front teeth. Determination of the position of the lateral teeth in individuals with eugnathic jaw ratios. Procedure for setting the posterior teeth. Definitive tooth placement. Final procedures in the production of complete dentures. Topographic classification of partial edentulous jaws and interrelationships between teeth and jaws. Forms and types of partial dentures. Partial acrylic denture: definition, parts. Planning of partial acrylic prosthesis. Laboratory production of partial acrylic denture. Removable partial denture: definition, types, parts. Retention, stabilization, transfer of occlusal loads, and guidance of removable partial denture. Application of parallelometers in the design and manufacture of removable partial dentures. Laboratory production of removable partial denture. Attachments and double crowns of partial dentures.

<b>Course: General Surgery</b>					
<b>Course Leader : Bojan Kovačević</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 6</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20OPHI</b>		
<b>Objectives of the course:</b> Acquiring knowledge of the general principles of surgery, surgical instruments, asepsis and antisepsis, diagnostics and preoperative preparation, surgical techniques and postoperative complications.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: <ul style="list-style-type: none"> <li>- take a medical history and perform a clinical examination of a surgical patient</li> <li>- recognize basic diagnostic procedures, their significance and limitations</li> <li>- apply the basic principles of asepsis and antisepsis in clinical practice</li> <li>- implement basic cardiopulmonary resuscitation measures</li> <li>- recognize basic surgical instruments and their usage</li> <li>- set bandages and immobilizers, give injections and infusions</li> <li>- perform haemostasis and demonstrate a basic knowledge of blood transfusion</li> <li>- recognize surgical infection, and perform abscess incision and drainage</li> <li>- know the basic principles of surgical techniques</li> <li>- know the basic principles of surgical oncology</li> <li>- recognize surgical emergencies</li> </ul>					
<b>Contents of the course:</b> The course should equip students with the knowledge of the basic principles of general surgery and a more detailed knowledge of certain areas of this specialty which are related to dentistry or have an influence on the practice of dentistry. The course provides students with information on general topics including wound healing and sepsis, bleeding, haemostasis, trauma, resuscitation, surgical infections. It covers important topics from vascular surgery, abdominal surgery, endoscopic surgery, thoracic surgery, urology and surgical oncology.

<b>Study programme:</b> Integrated Studies of Dental Medicine		<b>C16</b>	
<b>Level of studies: Second</b>			
<b>Course: Internal Medicine</b>			
<b>Course Leader (Name, middle letter, surname): Milan D.Brajovic</b>			
<b>Course status (compulsory/elective): Compulsory</b>			
<b>ECTS: 6</b>		<b>Year of the study: III / 5<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: ST20/INME</b>	
<b>Objectives of the course:</b> To enable the students to take a knowledgeable and critical attitude towards diseases in the field of internal medicine and to take a professional and safe attitude regarding the need for diagnostics and treatment of patients, with the aim of providing efficient and optimal planned dental treatment.			
<b>Outcomes of the course:</b> After successfully completing the course, the student should: Have the knowledge and competence to make an expert assessment in dental practice regarding the essential characteristics of the disease and potentially dangerous complications within all diseases in the field of internal medicine, so that the risks of side effects during the dental intervention are minimized; Have the knowledge and understanding of the etiology, pathophysiology, symptoms, diagnosis and treatment of all diseases; and Be able to prepare patients for dental interventions.			
<b>Contents of the course:</b> Lectures patient's history, physical examination - inspection, palpation, percussion and auscultation of the head and neck, chest, abdomen and extremities. Etiology, pathophysiology, clinical characteristics, diagnostics, therapy, and complications of the cardiovascular , respiratory, gastrointestinal, endocrine and metabolic, kidney and urinary tract, immune, connective tissue and joints and hematology system diseases. Practicals Patient's history, physical examination - general, head and neck, cardiovascular system, respiratory system, abdomen, and extremities. Pulmonary and cardiac diseases - case reports, a presentation, and a mid-term test; Digestive and endocrine diseases presentation - case reports and a mid-term test.

<b>Course: GENERAL MEDICINE (Infectious diseases, Neurology, Psychiatry, Ophthalmology, Dermatology)</b>				
<b>Course Leader (Name, middle letter, surname): Vesna T. Jovanović</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 4</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20MEDB</b>	
<b>Objectives of the course:</b> To introduce students to the basics of neurology, ophthalmology, dermatology, psychiatry and infectious diseases.				
<b>Outcomes of the course:</b>				
<ul style="list-style-type: none"> <li>- Students should be able to perform patient evaluation and recognize the most common medical conditions in the general population.</li> <li>- Students are familiar with emergency cases.</li> <li>- If a medical emergency is complex, students are familiar with appropriate medical referral procedures</li> </ul>				
<b>Contents of the course:</b> This course covers some of the most common diseases in the general population in response to real life situations. Several health professional programs (infectious diseases, neurology, ophthalmology and dermatology) will cover the basics needed to resolve some complex cases. It will include medical history, physical examination and investigations. Particular emphasis will be placed on medical emergencies and their management.

<b>Study Programme: Integrated Studies of Dental Medicine</b>			<b>C18</b>	
<b>Level of studies: Second</b>				
<b>Course: Fundamentals of Clinical Radiology</b>				
<b>Course Leader (Name, middle letter, surname): Biljana B. Marković Vasiljković</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 9</b>		<b>Year of the study: III/ 5<sup>th</sup> and 6<sup>th</sup> semesters</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: ST20RADI</b>		
<p><b>Objectives of the course:</b> The objective of the course is to provide students of dentistry with theoretical and practical instruction, and to gain a basic knowledge in dentomaxillofacial and general radiology. Acquiring knowledge of radiology will enable the students to understand and upgrade their knowledge of clinical dental subjects in the coming years during their studies.</p>				
<p><b>Outcomes of the course:</b> The students will adopt various radiological techniques and methodologies that they will be able to apply independently upon completion of the study, including those that they will be able to indicate in order to further evaluate the patient’s condition. With the acquired knowledge in the field of pathology and pathophysiology, the students will be able to observe and analyze their radiological presentation. The student will adopt measures and procedures, become familiar with technical equipment for protection against the side effects of ionizing radiation for both the patient and the personnel.</p>				
<p><b>Contents of the course:</b> The course Fundamentals of Clinical Radiology includes theoretical units and practical instructions concerning:</p> <ul style="list-style-type: none"> <li>- The nature and origin of X-ray radiation, principles of X-ray image formation, analog and digital records of X-ray image.</li> <li>- The introduction to X-ray machines and the biological effects of ionizing radiation, protection principles and dosimetry. Particular attention is given to radiographic intraoral, extraoral and tomographic methods used in the evaluation of the pathology of the dentomaxillofacial region.</li> <li>- The methodological units devoted to developmental disorders of the teeth and facial massif, inflammatory and tumoral changes of odontogenic and non-odontogenic origin. Radiological imaging of jaw cysts, diseases of salivary glands, temporomandibular joint and pathology of paranasal cavities are processed by clinical and radiological algorithm from conventional radiology to magnetic resonance imaging.</li> <li>- Radiological diagnostics and gradation of injuries to the teeth, surrounding tissue and facial region as a whole are addressed in separate methodological units.</li> <li>- Systemic diseases and their presentation in the dentomaxillofacial region have been addressed through appropriate radiological modalities.</li> <li>- Five methodological units are devoted to the basics of the heart, lung, digestive, and urinary tract radiology.</li> </ul>

<b>ECTS: 7</b>			<b>Year of the study: III / 5<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20FARM</b>		
<b>Objectives of the course:</b> To train the students to make an optimal and safe pharmacotherapy plan in dental practice.					
<b>Outcomes of the course:</b> After successfully completing the course, the student should have: <ul style="list-style-type: none"> <li>- The knowledge and competence to make the optimal and safe choice of medicines in the treatment of oral diseases and medical emergencies in the dental practice in the way that the risks of side effects and drug interactions are minimized.</li> <li>- The knowledge and understanding of the mechanisms of drug action, the fate of the drug in the body and the effects of drugs used in dentistry, as well as medicines that have a significant role in dentistry (which dental patients receive for medical reasons).</li> <li>-The skills of adapting a pharmacotherapy plan to dental patients at risk and knowledge to pharmacologically prepare patients at risk (cardiovascular, patients with special needs, psychiatric patients, and children) for dental interventions.</li> <li>-The competence to prescribe medicines in compliance with legal regulations.</li> <li>-A critical attitude towards available electronic databases of medicines.</li> </ul>					
<b>Contents of the course:</b> During the lectures and practicals students will be introduced to the basics of drug mechanisms of action, fate of drugs and effects of drugs used for oral and dental diseases, including the medicines important for dentistry (drugs which dental patients receive for medical reasons). Particular attention will be directed towards current pharmacotherapy protocols regarding the treatment of odontogenic and maxillofacial, periodontal and endodontic infections as well as oral mucosa diseases and competent drugs prescribing.

<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_3_02</b>		
<b>Objectives of the course:</b> Acquiring knowledge and skills related to the specificities of the application of oral hygiene products and techniques in special patient groups who are at high-risk for the development of dental caries and periodontal disease.					
<b>Outcomes of the course:</b> After completing the course, the students should be able to: -Recognize local factors important for maintaining oral hygiene -Relate local factors to the health of periodontal tissues -Know the specific means for maintaining oral hygiene in special patient groups (patients with fixed orthodontic appliances, restorations, fixed prosthetic replacements, and implants) -Select adequate means of maintaining oral hygiene as indicated -Know the techniques of maintaining oral hygiene in special patient groups					
<b>Contents of the course:</b> Identification of local factors important for maintaining oral hygiene; specific features of oral hygiene products for specific patient groups; specific techniques for performing oral hygiene in specific patient groups; analysis and evaluation of knowledge in the field of application of oral hygiene products and techniques in orthodontic and prosthetically treated patients; developing a plan for motivation, remotivation and control of oral hygiene in patients at risk; recommendations for the preservation of hard and soft tissues of the oral cavity

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>3E3</b>	
<b>Level of studies: Second</b>				
<b>Course: Prophylactic Measures in Restorative Dentistry</b>				
<b>Course Leader (Name, middle letter, surname): Zoran T. Mandinić</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_3_03</b>	
<b>Objectives of the course:</b> Acquisition and application of knowledge and skills in terms of applying prophylactic measures in restorative dentistry.				
<b>Outcomes of the course:</b> After completing the course, the student should be able to: -Recognize patients at high-risk for oral diseases (orthodontic patients, patients with restorations, dental surcharges and implants) -Identify iatrogenic factors in the occurrence of oral diseases (inadequate dental reimbursement; incorrectly selected matrices, fillings, prosthetics) -Know the measures of prophylaxis in the prevention of oral diseases in high-risk patients -Develop an effective plan for motivation, remotivation and control of therapeutic outcomes achieved in high-risk patients -Suggest recommendations for the preservation of hard and soft tissues in this specific group of patients				
<b>Content of the course:</b> Identification of patients at high-risk for the onset of oral diseases; identification of iatrogenic factors important for the health status of hard and soft tissues of the oral cavity; prevention measures for the occurrence of oral diseases in high-risk patients; the specificity of oral hygiene products for high-risk patients; the specifics of oral hygiene techniques in high-risk patients; measures of prophylaxis pertaining to the onset of oral diseases in high-risk patients; the use of prophylactic agents in high-risk patients (professional removal of soft deposits, air-polishing, removal of hard deposits); development of a plan of motivation, remotivation and control of achieved therapeutic results; recommendations for the preservation of hard and soft tissues of the oral cavity and dental restorations.

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>3E4</b>
<b>Level of studies: Second</b>			
<b>Course: Physical Basis of Diagnostic and Therapeutic Methods</b>			
<b>Course Leader (Name, middle letter, surname): Đorđe I Stratimirović</b>			
<b>Course status (compulsory/elective): Elective</b>			
<b>ECTS: 3</b>		<b>Year of the study: III / 6<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_3_04</b>	
<p><b>Objectives of the course:</b>          To get insights into the physical bases that underlie instrumental diagnostic methods.          Getting a broader picture of different diagnostic instruments and areas of their application. Understanding the effects of physical aspects on tissues and organs. Linking the ability to apply the diagnostic method to the physical properties on which it is based on. Understanding the functioning of diagnostic and therapeutic devices used in dental practice and proper interpretation of the results obtained. Getting to know the risks of using modern instruments for diagnostic and therapeutic methods.</p>			
<p><b>Outcomes of the course:</b>          After completing the class and passing the exam, the student should:</p> <ul style="list-style-type: none"> <li>- know the methods for measuring mechanical and thermodynamic quantities</li> <li>- know the theoretical basics of vibration and waves and recognize the usage of wave properties in diagnostic and therapeutic methods</li> <li>- understand the principles of ultrasound diagnostics</li> <li>- understand the use of electrical current in diagnostic and therapeutic techniques</li> <li>- understand the principle of lasers and points out the possibilities of its application in dentistry</li> <li>- understand what the spectrum of electromagnetic radiation is and differentiates between types of electromagnetic radiation</li> <li>- recognize and distinguish between different spectroscopic techniques and their field of application</li> <li>- differentiate between the types of ionizing radiation, including the area and methods of their application.</li> </ul>			
<p><b>Contents of the course:</b>          Methods for measuring macroscopic quantities. Wave theory and the wave model of matter. Mechanical waves and ultrasound. Electrical and magnetic methods of diagnosis and therapy. Electromagnetic waves and spectrum. Principles and fields of applications of different spectroscopic methods. Ionizing radiation and radiology. Fundamentals of nuclear diagnostics and therapies.</p>

<b>Course: Saliva As a Diagnostic Fluid</b>					
<b>Course Leader (Name, middle letter, surname): Tatjana M Todorović</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>				<b>Year of the study: III / 6<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>				<b>Course code: I_3_05</b>	
<b>Objectives of the course:</b> Acquiring knowledge of proper saliva sampling and the ways saliva can be used for diagnosing systemic and dental diseases, and for monitoring medicines, drugs, toxins and hormones					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: - take saliva samples properly. - determine the concentration of biochemical parameters in saliva. - analyze the concentration of biochemical parameters in saliva. - assess the condition of periodontium and oral mucosa based on biochemical analyses of saliva. - assess the general condition of the patient based on the biochemical analyses of saliva. - assess the risk of dental caries based on the physical and chemical properties of saliva.					
<b>Contents of the course:</b> Methods of saliva sampling. Physical and chemical properties of saliva as risk indicators of dental caries. Possibilities of using saliva in diagnosis of periodontitis, oral cancer, diseases of the oral mucosa, infectious diseases, autoimmune diseases, and for monitoring medicines, drugs, toxins and hormones.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>3E6</b>
<b>Level of studies: Second</b>				
<b>Course: Drug Abuse and Dental Practice</b>				
<b>Course Leader (Name, middle letter, surname): Jelena Roganović</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_3_06</b>	
<b>Objectives of the course:</b> To train students to recognize the signs of drug abuse and drug toxicity and understand their dental implications.				
<b>Outcomes of the course:</b> After successfully completing the course, the student should be able to: -Apply information about medicines obtained by critical review of available electronic databases in dental practice -Recognize the signs of drug toxicity in dental practice -Understand the plan of measures that should be taken in the treatment of drug toxicity -Appreciate potentially toxic interactions between nanomaterials used in dentistry and tissues -Understand the effects of drug abuse on oral tissues and implications for dental practice				
<b>Contents of the course:</b> Rational use and misuse of medicines; the effects of tobacco, alcohol, organic solvents and drug abuse on oral tissues; dental treatment in patients who abuse tobacco, alcohol, organic solvents and medicines; nanotoxicology; treatment of drug toxicity; relevant electronic databases of medicines.

<b>Level of studies: Second</b>				
<b>Course: Etiopathogenesis of Oral Cavity Diseases</b>				
<b>Course Leader (Name, middle letter, surname): Maja P. Miletic</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_3_07</b>	
<b>Objectives of the course:</b> Acquiring knowledge of the pathophysiological bases of immune system disorders, mechanisms of occurrence of changes in the oral region in various disorders of immunity and autoimmune diseases, etiopathogenesis of inflammatory processes in the oral region, the role of various mediators in the pathogenesis of inflammation of the dental pulp and periapical lesions, including the mechanisms of development of oral changes in various systemic diseases.				
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: - Describe the basics of the defence of organism - Relate oral changes to specific immune system disorders - Explain the mechanism of damage to the structure and function of the tissue of the oral region in immunodeficiency - Describe the oral manifestations that occur in various autoimmune diseases - Explain the immuno-inflammatory aspect of inflammation of the dental pulp and periapical lesions - Describe the mechanisms of occurrence of changes in the oral region in diseases of different organs and organ systems				
<b>Contents of the course:</b> Basics of non-specific and specific defense of organisms; disorders of non-specific defenses and changes in the oral region; congenital and acquired immunodeficiencies; pathogenesis of oral changes in immunodeficiency; mechanisms of oral manifestations in autoimmune diseases, etiopathogenesis of inflammation of the dental pulp and apical periodontium; the role of biologically active molecules, cytokines and chemokines in the inflammatory process; mechanisms of oral changes in various systemic diseases.

<b>Level of studies: Second</b>					
<b>Course: Molecular Mechanisms Involved in the Pathogenesis of Shock</b>					
<b>Course Leader (Name, middle letter, surname): Maja P. Miletic</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_3_08</b>		
<b>Objectives of the course:</b> Acquiring knowledge of the etiopathogenesis of shock, the underlying disorders of microcirculation in shock, hypoxia and postischemic cell damage, the molecular mechanisms involved in shock pathogenesis, the importance of cytokines and free radicals in shock, and systemic consequences.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the students should be able to: <ul style="list-style-type: none"> <li>- Describe the causes and pathophysiological bases of shock</li> <li>- Differentiate between different forms of shock</li> <li>- Associate microcirculation failure with cellular changes and disorders</li> <li>- Describe the metabolic and biochemical consequences of cellular hypoxia</li> <li>- Explain immuno-inflammatory events and the role of oxidative stress in the pathogenesis of shock</li> <li>- Relate pathophysiological events in shock to disorders of different organs and organ systems</li> </ul>					
<b>Contents of the course:</b> Definition, etiologic factors and shock classification; pathogenesis of shock syndrome; pathophysiological characteristics of microcirculation in shock; metabolic and biochemical consequences of reversible and irreversible hypoxic cellular injury; return injury; systemic inflammatory response, signaling cascade and the role of biologically active molecules in the pathogenesis of hemorrhagic and septic shock, shock complications and multi-organ dysfunction syndrome.

<b>Level of studies: Second</b>				
<b>Course: Systemic Complications Caused by Oral Infections</b>				
<b>Course Leader (Name, middle letter, surname): Nataša D. Petrović-Stanojević</b>				
<b>Course status (compulsory/elective): ELECTIVE</b>				
<b>ECTS: 3</b>		<b>Year of the study: III / 6<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_3_11</b>		
<p><b>Objectives of the course:</b> Gaining knowledge of the concept of the so-called focal infection theory. The pathogenesis of focal diseases is classically attributed to dental pulp pathologies and periapical infections. In recent years, there has been an increasing interest in the possible links between periodontal infection and systemic diseases. Periodontal pathogens and their products, as well as inflammatory mediators produced in periodontal tissues, can cause systemic effects and / or contribute to systemic diseases.</p>				
<p><b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to:</p> <ul style="list-style-type: none"> <li>- Describe the anatomical and pathophysiological bases of focal infections of the dental pulp and periapical infections</li> <li>- understand how inflammatory mediators and periodontal pathogens can affect the body</li> <li>- identify and recognize risk factors for adverse course of focal infection and develop an adequate treatment plan for such patients</li> <li>- plan diagnostic algorithms to identify such conditions</li> <li>- adopt the concept of a multidisciplinary approach to treating these patients</li> </ul>				
<p><b>Contents of the course:</b> Chronic periodontitis as a risk factor for cardiovascular and respiratory diseases, preterm birth, rheumatoid arthritis, osteoporosis, pancreatic cancer, metabolic syndrome, renal and some neurodegenerative diseases; Various hypotheses, including general susceptibility, systemic inflammation, direct bacterial infection and cross-reactivity, and / or molecular mimicry between bacterial and auto-antigens; Introduction to the concept of periodontal medicine – the correlation of periodontal disease with systemic diseases to explain these mechanisms; The most important diagnostic procedures for identifying such conditions.</p>

<b>Study Programme: Integrated Studies of Dental Medicine</b>				3E13
<b>Level of studies: Second</b>				
<b>Course: X-Ray Image Interpretation</b>				
<b>Course Leader (Name, middle letter, surname): Biljana Marković Vasiljković</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>		<b>Year of the study: III/ 6<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_3_13</b>		
<b>Objectives of the course:</b> The objective of the course "X-ray Image Interpretation" is to upgrade and broaden the student's knowledge of X-ray image analysis and interpretation in order to make a differential diagnosis.				
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: <ul style="list-style-type: none"> <li>- adopt the parameters of technically correct analogue / digital X-ray image record that can be interpreted</li> <li>- identify normal anatomical structures and tissues observed on intra- and extraoral images</li> <li>- identify the effects that can cause false positive and false negative image interpretations.</li> <li>- Student will adopt, step by step, elements of pathological X-ray image analysis.</li> <li>- Student will acquire knowledge of digital X ray image post-processing and presentation in 2D and 3D modes.</li> <li>- Based on the analysis of the obtained data, the students will be able to interpret findings and make a differential diagnosis.</li> </ul>				
<b>Contents of the course:</b> Definition and creation of an X-ray image, analog and digital recording methods. Normal radiological anatomy, composition and grading of dental, bone and soft tissue on intraoral and extraoral radiographs. Differentiation of pathological shadows and lucencies. Elements of pathological x-ray findings analysis: localization, shape, size, intensity, homogeneity, relationships and boundaries to the surroundings. Describing and interpreting x-ray data in accordance with referral diagnosis and clinical symptoms. Typical and less typical x-rays presentation of inflammatory, tumor, metabolic and systemic diseases. Radiological reporting and differential diagnosis.

<b>Level of studies: Second</b>					
<b>Course: Dental Biomechanics</b>					
<b>Course Leader (Name, middle letter, surname): Aleksandra M Milić Lemić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_3_14</b>		
<b>Objectives of the course:</b> Introducing students to the basic principles of dental biomechanics, the pattern of occlusal loading distribution and reactions of teeth, dental restoration and implants to occlusal loading.					
<b>Outcomes of the course:</b> After successfully completing the course the student should: - Understand the biomechanical principles of tooth behavior after occlusal loading - Be familiar with the bone and tissue response to occlusal loading - Be able to apply the acquired knowledge to the clinical courses dedicated to prosthodontics					
<b>Contents of the course:</b> Loading, stress and strain, bone tissue response to loading. The occlusal loading distribution. Teeth and biomechanical behavior after loading. Periodontal ligament and occlusal loading. Biomechanical principles of occlusion. Different concepts of occlusion and their biomechanical aspects. Biomechanical principles of removable and fixed prosthodontics. Biomechanical aspects of implants and implant restorations.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>3E15</b>	
<b>Level of studies: Second</b>					
<b>Course: Communication Skills In Dental Practice</b>					
<b>Course Leader (Name, middle letter, surname): Ivica Z. Stančić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_3_15</b>		
<b>Objectives of the course:</b> Acquiring knowledge of the forms and means of communication in dentistry. Specific communication knowledge Dentist - Patient, Dental Nurse - Patient, Dentist - Dental Nurse and Dentist - Other Healthcare Professionals.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should: - be able to successfully establish a contact with the patient, colleagues, and other members of the dental team, - possess professional skills in communication with patients, colleagues and the public, - resolve conflicts at all levels of communication.					
<b>Contents of the course:</b> Communication (definition, types, communication styles). Form of successful communication. Psychological preconditions for establishing communication. Basic communication skills. Verbal and nonverbal communication with the patient. Dimensions and aspects of non-verbal communication. The importance of non-verbal communication, body language. Tolerance as a precondition for successful communication. Types of personality structures of patients. Initial contact with a patient. Personality types. Conflict resolution strategy at all communication levels. Non-violent communication. Required characteristics of a health care professional and rules of good communication. Communication between medical professionals. Ethical decision making - basic principles. Patient's consent to interventions in dentistry. Basic principles of working with functionally dependent patients, patients of different ages, degrees of education, chronic patients, and patients with impaired hearing and vision. Teamwork in dentistry. Importance of keeping and saving medical records in clinical work.

<b>Course: Professional Ethics in Dentistry</b>					
<b>Course Leader (Name, middle letter, surname): Vesna B. Medic</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_3_16</b>		
<b>Objectives of the course:</b> Introducing students to: morality, general ethical principles and rules related to medical ethics, basic ethical principles in dentistry, moral rules of a dentist's behavior towards patients and colleagues, ethical aspects of scientific research and research on humans.					
<b>Outcomes of the course:</b> After completing the course, the student is trained to: <ul style="list-style-type: none"> <li>- explain the basic principles of ethics and morality</li> <li>- recognize ethical dilemmas in dentistry</li> <li>- make ethical decisions based on theoretical knowledge and moral reasoning</li> <li>- improve and use the acquired knowledge in their practice</li> </ul>					
<b>Contents of the course:</b> Ethics, morality and professionalism, classical and contemporary ethical principles; ethical principles in dentistry ethics; morality and professionalism; ethical principles in dentistry; ethical dilemmas and issues faced by dentists (how a dentist perceives the problem and solves it); the most important (general) ethical principles and rules: avoid harming the patient, doing well, patient autonomy, informing the patient. Other ethical principles: the principle of justice, the principle of truthfulness, principle of loyalty, principle of confidentiality. Relationship between a doctor and a patient. Moral rules of behavior – the doctor towards the patient. Ethical principles and communication between the dentist and patients with specific diseases: psychiatric patients, patients with special needs, children, elderly patients, patients suffering from infectious diseases. Ethical principles of research on humans, ethics in scientific research. Applying marketing principles in a private dental practice.

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>3E17</b>	
<b>Level of studies: Second</b>				
<b>Course: Digital Photography</b>				
<b>Course Leader (Name, middle letter, surname): Aleksandar B Todorovic</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>		<b>Year of the study: III / 6<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_3_17</b>		
<p><b>Objectives of the course:</b>                  To gain a basic knowledge of digital cameras, how they are used and their application in clinical practice. To gain knowledge of photography - how it was created. Data processing and storage. Protocols and techniques for intraoral photography. Extraoral photography protocols and techniques. Digital photo processing and data storage. Specificity of photography techniques in orthodontics. Specific features of photography techniques in oral and periodontal surgery.</p>				
<p><b>Outcomes of the course:</b>                  After completing the course and passing the exam, the student should be able to:                  - Describe the basic features of digital cameras and how they are used.                  - Describe how digital photography can be stored.                  - Explain the protocol for intraoral photography.                  - Explain the protocol for extraoral photography.                  - Describe photography techniques in oral surgery and orthodontics.</p>				
<p><b>Contents of the course:</b>                  Photo definition and basic parameters, physical characteristics of photography. Different types of digital cameras, photography techniques, photography equipment. Intraoral photography, camera setup, photography technique. Extraoral photography, camera setup, photography technique. Programs for digital image processing, methods for storing digital photos.</p>

<b>Course: Color in Dentistry</b>					
<b>Course Leader (Name, middle letter, surname): Aleksandar Todorovic</b>					
<b>Course status (compulsory/elective): elective</b>					
<b>ECTS: 2</b>			<b>Year of the study: III / 6<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_3_18</b>		
<p><b>Objectives of the course:</b>          Acquiring knowledge of physical characteristics of color, procedures for determining the color of teeth, dental restorations and restorations made of different types of restorative materials, instruments and methods for color determination in clinical and laboratory conditions, color reproduction techniques using different dental materials, the persistence of color compensation and the impact of the environment on the overall experience of color.</p>					
<p><b>Outcomes of the course:</b>          After taking the course and passing the exam, the student should be able to:          - Describe the basic physical characteristics of color.          - Determine the tooth color and color of dental restorations in clinical and laboratory condition.          - Determine the tooth color applying visual methods for determining the tooth color.          - Explain color reproduction techniques for making dental restorations of different types of building materials          - Describe how environments and external factors affect the overall color experience.</p>					
<p><b>Contents of the course:</b>          Color definition and basic color parameters; color as a physical phenomenon; color reproduction; factors that influence the perception and determination of tooth color; conventional determination of color and dental restoration; digital determination of tooth color and dental restorations; color determination protocol; the role of digital photography in color determination; color of dental materials - their compatibility, stability and interaction, color of permanent teeth in young persons; color in the treatment of hypermineralized teeth.</p>

<b>Study programme:</b> <b>Integrated Studies of Dental Medicine</b>				<b>C20</b>	
<b>Level of studies: Second</b>					
<b>Course: Anesthesia in Dentistry and Basic Principles of Oral Surgery</b>					
<b>Course Leader (Name, middle letter, surname): Radojica V Drazic</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 7</b>			<b>Year of the study: IV / 8<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20ANES</b>		
<p><b>Objectives of the course:</b> The most important goal of this course is to equip students with the knowledge and skills necessary for the application of local anesthesia and tooth extraction. The students should be trained to perform the techniques of terminal anesthesia in the upper and lower jaw, and mandibular anesthesia on their own. The students should be able to apply local anesthesia to patients at risk, in other dental disciplines, and to recognize and treat possible local and general complications of local anesthesia. In addition, the student should take a medical history, perform a clinical examination, synthesize the obtained data, and diagnose the most common dental diseases. In addition, the students will learn how to recognize the most common indications for tooth extraction. The students are required to learn the stages of tooth extraction and to master the techniques of extracting individual teeth in the upper and lower jaws. The student is obliged to learn and master the procedures of asepsis and antisepsis in oral surgery, and learn the stages of normal wound healing after tooth extraction.</p>					
<p><b>Outcomes of the course:</b> After taking the course and passing the exam, the student should:</p> <ul style="list-style-type: none"> <li>- have a deep understanding of the methods for pain control in dental practice, i.e. the benefits provided by isolated local anesthesia, the combined use of local anesthesia and pharmacosedation, and be familiar with the application of general anesthesia in dental practice.</li> <li>- know the properties of individual local anesthetic solutions, and the use of local anesthetic solutions</li> <li>- administer infiltration anesthesia in the upper and lower jaws, administer mandibular anesthesia and other terminal and block anesthesia in the jaws on their own.</li> <li>-be fully capable of selecting an adequate local anesthetic solution in at-risk patients.</li> <li>- demonstrate knowledge of the practical application of local anesthesia in each of the dental disciplines and know the indications, advantages and disadvantages of individual methods of local anesthesia, -prevent, recognize, and cure any complications of local anesthesia (local and general),</li> <li>-take the patient's history on their own, perform a clinical examination and diagnose the most common dental diseases,</li> <li>- choose the appropriate instruments for tooth extraction,</li> <li>- perform tooth extraction of individual teeth in the upper and lower jaws on his own; learn and implement asepsis and antisepsis procedures in oral surgery,</li> <li>- recognize the phases of normal wound healing of alveolar socket after tooth extraction.</li> </ul>					
<p><b>Contents of the course:</b> Local anesthetic solutions; relevant anatomy; topical, local, general anaesthesia, analgesia and sedation and its combination. Techniques of infiltration and block anesthesia in upper and lower jaw. Complications of local anesthesia. Local anesthesia in risk patients and in other dental disciplines. Tooth extractions: indications, instruments, techniques, and wound healing after tooth extractions.</p>

<b>ECTS: 10</b>			<b>Year of the study: IV / 7<sup>th</sup> and 8<sup>th</sup> semesters</b>		
<b>Entry requirements (passed exams from the previous years): /</b>			<b>Course code: ST20REOD</b>		
<b>Objectives of the course:</b> Acquiring knowledge and skills for independent diagnostics and treatment of lesions of hard dental tissues using adequate methods, materials and instruments of modern restorative dentistry.					
<b>Outcomes of the course:</b> Upon successful completion of the course, students should be able to: <ul style="list-style-type: none"> <li>– explain pulp-dentin complex and its defense mechanisms,</li> <li>– use equipment and instruments in the dental practice,</li> <li>– record patient's dental and medical history, perform clinical examination, establish diagnosis and treatment plan,</li> <li>– explain and perform all types of cavity preparation, retention and restoration options according to gnathological principles, and use contemporary materials, instruments and equipment for permanent restorations,</li> <li>– explain and perform all treatment options for pulp vitality preservation in deep caries and trauma cases,</li> <li>– explain and analyze methods for cavity preparation and impression taking, indirect restoration production and cementation (metal and esthetic), and advantages over direct restorations,</li> <li>– explain biophysical changes in and analyze principles of restoration of endodontically treated teeth,</li> <li>– explain the options and agents for bleaching vital and non-vital teeth and analyze esthetic effects, potential complications and limitations of such procedures</li> </ul>					
<b>Contents of the course:</b> Pulp-dentin complex and its defense mechanisms, caries, noncarious lesions, trauma, exposed pulp, introduction to clinical practice of restorative dentistry, teamwork, workflow, tooth isolation, minimally invasive procedures in restorative dentistry, materials for management of deep caries and exposed pulp, restorative procedure, matrix systems, materials for permanent restorations, materials for temporary fillings, glass-ionomer cements, adhesive systems, composite materials, amalgam, restorative procedure in anterior teeth, restorative procedure in posterior teeth, polymerization of resin-based materials, light-curing units, clinical procedure for indirect restorations, CAD-CAM of indirect restorations, restoration repair, restoration endodontically treated teeth, tooth bleaching.

<b>Level of studies: Second</b>				
<b>Course: Removable Prosthodontics</b>				
<b>Course Leader (Name, middle letter, surname): Aleksandra M MilićLemić</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 10</b>		<b>Year of the study: IV / 7<sup>th</sup> and 8<sup>th</sup> semesters</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: ST20MOBI</b>		
<b>Objectives of the course:</b> Obtaining the theoretical and practical knowledge required for independent performance of clinical procedures in removable prosthodontics, including the proper use of modern dental materials, equipment and instruments.				
<b>Outcomes of the course:</b> After successfully completing the course, the students should: -Understand the changes in the orofacial system after tooth loss -Demonstrate the theoretical knowledge about the clinical procedures in manufacturing complete dentures, partial acrylic and removable partial dentures. -Be trained to realize the preliminary and final impressions, determine jaw relations and perform the teeth set-up. -Be capable of delivering complete and partial dentures, giving instructions to the patients and perform later check-ups. -Be introduced to clinical procedures in manufacturing complex partial dentures with precision elements or double crowns -Have the theoretical knowledge of producing overdentures and implant-supported removable dentures				
<b>Contents of the course:</b> Focusing on the manipulation of dental materials most commonly used in the dental office, theoretical lectures also discuss the basic scientific approach to clinical procedures in complete denture and removable partial denture fabrication. The course is also concerned with the patients' general and oral health, diagnosis and therapy options and planning. General steps like choosing the proper impression tray, impression taking and all others are performed in different patients during different clinical cases. The students will also learn about the rationale in RPD framework designs, communication with the laboratory technicians and dental assistants. At the end of the course the students are introduced in specific types of dentures including overdentures and implant supported removable dentures.

<b>Course: Preclinical Fixed Prosthodontics</b>					
<b>Course Leader (Name, middle letter, surname): Ljiljana Đ Tiháček Šojić</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 7</b>			<b>Year of the study: IV/ 7<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20FPRO</b>		
<b>Objectives of the course:</b> Obtaining theoretical and practical knowledge of the technical and technology procedures in manufacturing different types of fixed restorations (crowns and bridges)					
<b>Outcomes of the course:</b> After successfully completing the course, the student should be: -Able to perform diagnostic wax-up, -Capable of modeling different wax restorations such as full crowns, cast post and core, metal coping of porcelain fused to metal -Familiar with laboratory procedures employed in manufacturing different fixed restorations. -Introduced to modern materials used in fabricating fixed restorations					
<b>Contents of the course:</b> The lectures provide dental students with a foundation necessary to understand the basic principles of fixed prosthodontics, basic science, followed by practical step-by-step laboratory applications. The theoretical lectures focus on laboratory procedures but involve introduction to clinical sessions. The practicals are organized as a systematic follow-up of laboratory procedures in manufacturing different types of fixed restorations. The course covers most modern materials used in fabricating fixed restorations from wax to metal alloys.

<b>Study Programme: Integrated Studies of Dental Medicine</b>			<b>C24</b>	
<b>Level of studies: Second</b>				
<b>Course: Oral Medicine</b>				
<b>Course Leader (Name, middle letter, surname): Saša S. Čakić</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS:7</b>			<b>Year of the study: IV / 7<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code:ST20ORME</b>	
<p><b>Objectives of the course:</b>          To strengthen the students' capacities by equipping them with the skills and knowledge required for a comprehensive interdisciplinary approach to the diagnosis, planning and implementation of treatment regarding the patients with pathologies involving oral medicine.</p>				
<p><b>Outcomes of the course:</b>          After successfully completing the course, the student should be qualified to:</p> <ul style="list-style-type: none"> <li>- Asses medical history</li> <li>- Conduct clinical examination             <ul style="list-style-type: none"> <li>recognition of symptoms and signs of oral diseases</li> <li>recognition of oral manifestations of systemic diseases</li> <li>recognition of symptoms and signs of premalignant and malignant diseases</li> </ul> </li> <li>- Carry out diagnostic procedures</li> <li>- Analyze and interpret medical records</li> <li>- Make a treatment plan</li> <li>- Explain to patients the assessment of their problems and the plan for further testing and treatment</li> <li>- Perform clinical procedures (prevention and treatment)</li> <li>- Diagnose medical emergencies and administer appropriate medications</li> <li>- Perform emergency interventions</li> </ul>				
<p><b>Contents of the course:</b>          Diagnostic methods in oral medicine, Oral manifestations of infections: bacterial (non-specific, specific, fungal,viral), Hereditary and developmental anomalies of oral mucosa, Oral manifestations of human immunodeficiency virus (HIV) infection / Acquired Immune Deficiency Syndrome (AIDS), Oral diseases as a result of sexual contact, Diseases of the lips, Diseases of the tongue, Salivary gland diseases, Oral mucosal injuries caused by physical, chemical, thermal, radiation agents as well as bad habits, Oral ulceration, Afte, Oral manifestations of systemic diseases (gastrointestinal, haematological, cardiovascular, respiratory, endocrine, metabolic, renal, neurological and psychiatric) and vitamin deficiency, Mucocutaneous bullous dermatoses,Orofacial pain, neuralgia and temporomandibular joint - glossodynia and glossopyrosis, burning mouth syndrome, subjective xerostomia and idiopathic dysgeusia, White and red oral mucosal lesions,Inflammatory hyperplasia, nonspecific granulomas and benign tumors, Precancerous conditions and neoplasms, Principles of therapy in oral medicine, Pharmacology related to Oral medicine.</p>				
<p><b>Recommended literature:</b></p> <ol style="list-style-type: none"> <li>1. Field A, Logman L, Tyldesley W.: Tyldesley's oral medicine, 5th edition, Oxford University Press, 2003.</li> <li>2. <b>Study Programme: Integrated Studies of Dental Medicine</b>				<b>C25</b>
<b>Level of studies: Second</b>				
<b>Course: Preclinical Periodontology</b>				
<b>Course Leader (Name, middle letter, surname): Zoran M Aleksic</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 7</b>		<b>Year of the study: IV / 8<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: ST20PAR1</b>		
<p><b>Objectives of the course:</b>                  Training students to carry out diagnostic procedures in periodontology, gaining knowledge of the basic principles of professional and personal patient care in terms of oral and periodontal health. Training students to apply treatment concepts in prevention and initial periodontal therapy.</p>				
<p><b>Outcomes of the course:</b>                  After completing the course, the students should be able to:</p> <ul style="list-style-type: none"> <li>- Demonstrate knowledge of anatomical, histological and topographical characteristics of the periodontium;</li> <li>- Understand the etiology and pathogenesis of periodontal disease and know the risk factors for the emergence and development of the disease;</li> <li>- Govern diagnostic procedures and protocols for the periodontal documentation formation;</li> <li>- Establish the final diagnosis of periodontal disease;</li> <li>- Assess oral hygiene level and assess the periodontal condition by means of adequate periodontal parameters/indices;</li> <li>- Demonstrate adequate knowledge of manual and machined instruments used in periodontal treatment.</li> <li>- Know the basic principles of instrumentation and fixation techniques;</li> <li>- Recognize indications for application of various medications during periodontal treatment</li> </ul>				
<p><b>Contents of the course:</b>                  Anatomical and histological principles of the periodontal diseases. Classification of periodontal diseases and conditions. Epidemiology of periodontal diseases. Prognosis and treatment plan. Diagnostic tools for final diagnosis establishment. Radiographic tools used in periodontology. Etiopathogenetic mechanisms of periodontal disease. Occlusion and periodontal disease. Gingivitis and differential diagnosis towards periodontal disease. Initial periodontal therapy. Risk factors, modifying factors and aging. Medications in periodontal treatment.</p>				
<p><b>Recommended literature:</b>                  Lindhe J, Lang NP and Karring T. Clinical periodontology and implant dentistry. 5<sup>th</sup> edition. Wiley-Blackwell, 2009. Pages: 3-215, 352-381, 403-413, 432-508.</p>				
<p><b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.</p>

<b>Study Programme: Integrated Studies of Dental Medicine</b>			<b>C26</b>	
<b>Level of studies: Second</b>				
<b>Course: Preclinical Endodontics</b>				
<b>Course Leader (Name, middle letter, surname): Nevenka S Teodorović</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 6</b>			<b>Year of the study: IV / 8<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20PREN</b>	
<b>Objectives of the course:</b> To teach and train students to acquire all necessary knowledge and skills to endodontically treat teeth affected by pulpal and periapical disease				
<b>Outcomes of the course:</b> After completing the course, the student should be able to: <ul style="list-style-type: none"> <li>-Demonstrate the knowledge of isolation of the clinical crown, handling and use of rubber dam</li> <li>-Demonstrate the knowledge of basic principles and endodontic treatment methodology</li> <li>-Demonstrate a profound knowledge of tooth morphology and root canal anatomy</li> <li>-Demonstrate the knowledge of the objectives and guidelines for access cavity preparation and practical skills to prepare all types of access cavities on the models</li> <li>-Possess theoretical knowledge and practical skills to conduct different methods of measuring canal length in laboratory conditions</li> <li>-Possess theoretical knowledge of various types of endodontic instruments practical skills to use them in the root canal therapy of acrylic teeth of different morphological groups</li> <li>- Knowledge about medications and irrigating solutions and chemo- mechanical root canal preparation of acrylic teeth</li> <li>-Demonstrate the theoretical knowledge of different techniques regarding definitive root canal obturation and practical skills to perform mono-cone technique and lateral condensation technique for permanent root canal obturation of acrylic teeth</li> <li>-Possess the knowledge and competencies to perform every basic step in endodontic procedure and understand the direct relation to treatment outcomes</li> <li>-Demonstrate the theoretical and practical knowledge of endodontic therapy that can be used in clinical conditions</li> </ul>				
<b>Contents of the course:</b> Key points and goals of endodontic therapy , teeth morphology and root canal anatomy. Different endodontic instruments and equipment of clinical endodontic practice. Manual techniques for root canal preparation, irrigation procedures and various irrigating solutions and medicaments. Materials and techniques for definitive root canal obturation. Practical courses and student independent preclinical practice using models and acrylic teeth: Direct training for preclinical endodontic procedure, instruments for access cavity preparation, instruments and manual techniques for root canal preparation (Step-back, Crown- down) on acrylic teeth. Medication and methodology of root canal irrigation. Different materials and techniques for permanent root canal obturation.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>4E1</b>
<b>Level of studies: Second</b>				
<b>Course: Materials for Direct Esthetic Restorations</b>				
<b>Course Leader (Name, middle letter, surname): Vesna J. Miletić</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>		<b>Year of the study: IV / 8<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_4_01</b>		
<b>Objectives of the course:</b> Acquiring knowledge of the composition, properties, classifications, indications and clinical application of materials for direct esthetic restorations (composites, glass-ionomer cements and hybrid materials)				
<b>Outcomes of the course:</b> Upon successful completion of the course, students should be able to: <ul style="list-style-type: none"> <li>- explain material composition and setting reaction,</li> <li>- analyze material selection for specific indications,</li> <li>- describe clinical procedures involving specific material types,</li> <li>- critically appraise current criteria for restoration clinical assessment,</li> <li>- evaluate method selection for restoration repair in specific clinical situations,</li> <li>- identify and describe the importance of biological properties of these materials</li> </ul>				
<b>Contents of the course:</b> Composites, glass-ionomer cements and hybrid materials: composition, classifications, properties, setting reactions, indications and clinical procedure, clinical assessment of restorations, laboratory testing of material properties, restoration longevity, restoration repair and biological aspects of esthetic materials.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>4E2</b>	
<b>Level of studies: Second</b>					
<b>Course: Discolorations of Vital Teeth</b>					
<b>Course Leader (Name, middle letter, surname): Tatjana V. Savić-Stanković</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: IV/ 8<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_4_02</b>		
<b>Objectives of the course:</b> Gaining knowledge of the types, causes and mechanisms of vital tooth discoloration; diagnostic significance of tooth discoloration; the mechanisms of its formation, the materials and clinical methods of vital teeth bleaching; side effects of therapy; causes of tooth hypersensitivity after therapy; contraindications and post-treatment procedures.					
<b>Outcomes of the course:</b> After taking the lectures and passing the exam, the student should be able to: <ul style="list-style-type: none"> <li>- describe the basic factors and mechanisms of vital tooth discoloration</li> <li>- describe the characteristics of existing whitening agents</li> <li>- explain the types and characteristics of clinical teeth whitening methods</li> <li>- describe all the procedures prior to vital teeth whitening process</li> <li>- select an adequate therapeutic method in regard to diagnosis</li> <li>-explain the therapeutic procedure of taking care of possible side effects of procedure</li> </ul>					
<b>Content of the course:</b> Characteristics of optical properties of hard dental tissues; the definition, causes and classification of vital tooth discoloration; definition of the mechanism of tooth discoloration; types of agents and the mechanism of their whitening action; the process of preparing vital teeth whitening therapy; methods of whitening vital teeth; contraindications in bleaching therapy; side effects of therapy; definition and factors of tooth hypersensitivity; post-therapeutic procedures for the revitalization of hard dental tissues.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>4E3</b>	
<b>Level of studies: Second</b>					
<b>Course: Minimum Intervention Cariology</b>					
<b>Course Leader (Name, middle letter, surname): Tamara O. Peric</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: IV /8<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_4_03</b>		
<b>Objectives of the course:</b> To acquire knowledge of non-invasive, micro-invasive, and minimally invasive techniques for diagnostic and treatment of dental caries.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to/know how to: <ul style="list-style-type: none"> <li>- assess the caries risk;</li> <li>- use caries prevention methods;</li> <li>- apply methods for early caries detection;</li> <li>- make the choice and is able to apply non-invasive and micro-invasive techniques for treatment of the initial caries lesion;</li> <li>- know the principles of minimally invasive cavity preparation in both enamel and dentine;</li> <li>- use alternative cavity preparation techniques;</li> <li>- create an effective individual treatment plan.</li> </ul>					
<b>Content of the course:</b> Minimum intervention cariology - definition, basic principles; Caries risk assessment; Caries prevention methods (control of dental plaque, diet modifications, chemoprophylaxis); Early caries detection- methods and techniques; Non-invasive caries treatment- external and internal remineralization; Micro-invasive caries treatment- fissure sealing; Micro-invasive caries treatment- resin infiltration; Minimally invasive cavity preparation in enamel; Minimally invasive cavity preparation in dentine; Modern techniques for cavity preparation (air abrasion, ultrasonic preparation, lasers, chemo-mechanical method, polymer / ceramic burs, etc.); Individual treatment plan.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>4E4</b>	
<b>Level of studies: Second</b>					
<b>Course: Dental Care for Children with Rare Diseases</b>					
<b>Professor in charge Mirjana D Ivanovic</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: IV/ 8<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_4_04</b>		
<p><b>Objectives of the course:</b>          Acquiring knowledge about the concept of rare diseases, the way of occurrence of rare diseases, the possibilities of diagnosis of rare diseases, the oral health status of children with rare diseases and the possibilities of dental treatment of children, depending on the rare disease present.</p>					
<p><b>Outcomes of the course:</b>          After completing the course and passing the exam, the student should be able to:          - Admit a child with a rare disease appropriately to the dental office          - Make contact with children with rare diseases and parents of diseased children          - Recognize the specificities of oral diseases in children with rare diseases          - Diagnose oral diseases in children with rare diseases          - Know the protocols for dental care for children with various rare diseases          - Develop a plan for preventive, prophylactic and therapeutic measures, depending on the type of rare disease</p>					
<p><b>Contents of the course:</b>          Definition, etiology, epidemiology of rare diseases in children; Diagnosis of rare diseases; Oral manifestations of various rare diseases in children; Methods of dental care for children with rare diseases, outpatient work, sedation and general anesthesia; Knowledge and application of protocols for dental care of children with rare diseases, depending on the type of disease, preventive, prophylactic and therapeutic measures.</p>

<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: IV/ 8<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_4_07</b>		
<b>Objectives of the course:</b> The learning objective of this particular course is to provide a practical and theoretical knowledge of cranial nerves from the viewpoint of the clinical significance for dentistry.					
<b>Outcomes of the course:</b> After attending this course and passing the exam, the students should be able to: -Describe pathways of cranial nerves -Define the type of fiber of each of the cranial nerves -Describe autonomic ganglions attached to the final branches of the trigeminal nerve -Determine innervation zones of the head and neck especially the orofacial region -Define projection pathways of the central nervous system, downstream (the corticobulbar tract) and upstream (the medial lemniscus pathway and the gustatory pathway), for the purpose of getting a comprehensive insight into cranial nerves					
<b>Contents of the course:</b> <i>Nn. olfactorii. N.opticus. N. oculomotorius. N.trochlearis. N. trigeminus. N. abducens. N. facialis.N. vestibulocochlearis. N.glossopharyngeus. N. vagus N.accessorius. N.hypoglossus.</i> Cranial nerve nuclei. The corticobulbar tract. The medial lemniscus pathway. The gustatory pathway.

<b>Level of studies: Second</b>				
<b>Course: Antibiotic Prophylaxis in High-Risk Patients</b>				
<b>Course Leader (Name, middle letter, surname): Petrovic B. Milan</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>		<b>Year of the study: IV / 8<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_4_09</b>		
<b>Objectives of the course:</b> Acquiring knowledge required for recognizing high-risk patients during dental interventions and complications that may occur after a dental session. Gaining knowledge required for selecting and applying antibiotic treatment in high-risk patients, performing follow-ups, and detecting possible complications.				
<b>Outcomes of the course:</b> Upon completing the course and passing the exam, students should be able to: <ul style="list-style-type: none"> <li>- Recognize a high-risk patient during a dental session</li> <li>- Anticipate possible complications that may occur</li> <li>- Explain to a patient what complications may occur after a dental session and what is to be done to prevent them</li> <li>- Choose the right therapy for high-risk patients, either independently or in cooperation with another medical specialist</li> <li>- Follow up results of treatment in high-risk patients</li> <li>- Ascertain possible complications that may occur despite the applied treatment</li> </ul>				
<b>Contents of the course:</b> Definition of high-risk patients. Diseases and their symptomatology which classify patients as high-risk in dental sessions. The way of identifying high-risk patients. Dental interventions which can initiate complications in certain diseases. Antibiotics applied with high-risk patients. Supervising patients after the application of antibiotic prophylaxis. Complications that occur after applying inadequate antibiotic prophylaxis. Treatment of complications in high-risk patients.

<b>ECTS: 3</b>			<b>Year of the study: IV / 8<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_4_18</b>		
<p><b>Objectives of the course:</b> Getting familiar with the aging process and timely dental care in elderly patients through clinical and preventive methods in order to provide maximum care of the orofacial system with adequate prosthodontic rehabilitation of elderly and ill patients.</p>					
<p><b>Outcomes of the course:</b> After successfully finishing the course the student should be able to: -recognize differential diagnosis of the pathological changes and emergencies in the oral cavity, -understand adequate dental treatment, depending on the mental and physical condition of elderly patients, -suggest the appropriate prosthetic treatment depending on the age, cooperative level and general health status of the patient.</p>					
<p><b>Contents of the course:</b> During lectures and practicals the students will be introduced to specific procedures in dental treatment of elderly patients. Also, all aspects of ageing are analysed, with manifestations of aging in stomatognathic system. Special attention will be given to oral health quality of life and indices used to measure it. Also, different treatment modalities will be analysed through discussion.</p>

<b>Study Programme: Integrated Studies of Dental Medicine</b>		<b>C27</b>	
<b>Level of studies: Second</b>			
<b>Course: Pediatric Dentistry</b>			
<b>Course Leader (Name, middle letter, surname): Zoran R. Vulicevic</b>			
<b>Course status (compulsory/elective): Compulsory</b>			
<b>ECTS: 11</b>		<b>Year of the study: V / 9<sup>th</sup> and 10<sup>th</sup> semesters</b>	
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: ST20DEST</b>	
<b>Objectives of the course:</b> To inform the students about the specificities of dental work in pediatric and adolescent patients, as well as the peculiarities of treatment during primary, mixed and young permanent dentition.			
<b>Outcomes of the course:</b> After successfully completing the course, the student should: <ul style="list-style-type: none"> <li>- Be familiar with the basic goals of pediatric dentistry, the importance of preserving the health of the mouth and teeth in children, as well as the specifics of working with children;</li> <li>- Be familiar with the clinical techniques and psychological types of children;</li> <li>- Be familiar with the characteristics of primary and permanent dentition, as well as the characteristics of caries of different dentitions;</li> <li>- Comprehend the specifics of cavity preparations on primary and permanent teeth;</li> <li>- Be familiar with the principles of minimally invasive dental treatments;</li> <li>- Be familiar with the techniques of local anaesthesia in children;</li> <li>- Be familiar with the dental materials used in pediatric dentistry;</li> <li>- Demonstrate knowledge of the specifics of endodontic therapy of primary and young permanent teeth;</li> <li>- Be familiar with the basics of oral-surgical interventions in children;</li> <li>- Applies basic principles in the treatment of dental injuries;</li> <li>- Know the basic principles of treatment of pulpitis of primary and young permanent teeth;</li> <li>- Know the principles of treatment of dentogenic infections in children;</li> <li>- Diagnose periodontal diseases in children;</li> <li>- Diagnose bacterial and other diseases in the mouth of children;</li> <li>- Know the principles of emergency management in pediatric dentistry;</li> <li>- Know the principles of prosthetic care in pediatric dentistry;</li> <li>- Know the principles of dental care for children with invalidity.</li> </ul>			
<b>Contents of the course:</b> Diagnostic methods, dental examination and treatment planning in pediatric dentistry; Behavioral management and minimal sedation in pediatric dentistry; Pain control in pediatric dentistry; Cavity preparation on primary teeth; Orofacial system growth and development; Irregularities in the development of the orofacial system and treatment options in pediatric dentistry; Minimally invasive therapy; Treatment of early childhood caries; Soft tissue disease and bacterial infection of the oral cavity in children; Oral manifestations of viral diseases in children; Diagnosis of primary and permanent teeth pulp condition; Treatment of young permanent and permanent teeth; Dental injuries in children: classification, treatment and complications; Oral manifestations of systemic diseases in children; Oral surgery, tumors and cysts in children; Molar incisor hypomineralization (MIH); Periodontal diseases in pediatric dentistry; Dental care for children with medical risk and rare diseases; Dentogenic infection therapy and antibiotics in pediatric dentistry; Emergency conditions in pediatric dentistry; Prosthetic care for children and adolescents; Dental treatment of children with invalidity.

<b>Study Programme: Integrated Studies of Dental Medicine</b>				<b>C28</b>	
<b>Level of studies: Second</b>					
<b>Course: Oral Surgery</b>					
<b>Course Leader (Name, middle letter, surname): Bojan D. Janjić</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 10</b>			<b>Year of the study: V / 9<sup>th</sup> and 10<sup>th</sup> semesters</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20ORAL</b>		
<b>Objectives of the course:</b> Acquiring the knowledge and skills necessary for self-diagnosis of oral surgical diseases, training students to perform simple and complicated tooth extractions independently, diagnose and treat dentogenic infections.					
<b>Outcomes of the course:</b> After completing the course and passing the oral surgery exam, the student should be able to: <ul style="list-style-type: none"> <li>- independently perform the necessary diagnostic procedures in order to make a diagnosis of oral surgical diseases</li> <li>- independently perform simple extractions of the erupted teeth, residual roots, complicated tooth extractions and eliminate post-extraction complications</li> <li>- diagnose patients at risk and to prepare them adequately for tooth extraction</li> <li>- treat acute and chronic dentogenic infections and administer appropriate medicines</li> <li>- prescribe medicines for preoperative, operative and postoperative treatment of oral surgery patients and to establish local hemostasis during and after surgical interventions</li> <li>- set an indication for the surgical treatment of periapical lesions</li> <li>- be familiar with the basic principles of dental trauma treatment</li> <li>- diagnose oroantral communications and carry out conservative care of them</li> </ul>					
<b>Contents of the course:</b> During the Oral Surgery course, the student should learn how to take anamnesis, perform a clinical examination and diagnose oral-surgical diseases, independently perform simple and complicated tooth extractions, diagnose and treat intra and post-extraction complications, diagnose and treat dentogenic infections, medicines for the therapy of oral surgery patients, recognize patients at risk and prepare them for oral surgery, diagnose pathological lesions on the teeth and the jaws and lining and indications for their therapy. Also, the student should become acquainted with the basic principles of oral surgery, make a plan of therapy, and assist during minor oral surgeries. Each student should become familiar with the basic principles of the treatment of orofacial pain, diagnose tooth traumas and oroantral communications and conduct their appropriate therapy.

<b>Study Programme: Integrated Studies of Dental Medicine</b>				<b>C29</b>	
<b>Level of studies: Second</b>					
<b>Course: Fixed Prosthodontics</b>					
<b>Course Leader (Name, middle letter, surname): Aleksandar B. Todorović</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 12</b>			<b>Year of the study: V/ 9<sup>th</sup> and 10<sup>th</sup> semesters</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20FSPR</b>		
<b>Objectives of the course:</b> To train the students to perform the clinical phases in fixed restorations production by their own					
<b>Outcomes of the course:</b> After the mastering student should be able to: <ol style="list-style-type: none"> <li>1. Have the knowledge required to determine the diagnosis and choose the most optimal therapy with fixed restorations reconstruction in dental practice</li> <li>2. Have the knowledge required to make the preparation of the teeth for different fixed restorations singly in dental practice (crowns, bridges)</li> <li>3. Have the knowledge required to choose the optimal material necessary for fixed restorations production</li> <li>4. Have the knowledge required to select the optimal technique and material in impression taking procedures</li> <li>5. Have the knowledge required to carry out all clinical phases during the treatment with fixed restorations according to gnathological principles</li> <li>6. Have the skills and knowledge to carry out the cementation procedure as the final step in fixed restorations implementation</li> <li>7. Have the knowledge of how to recognize different craniomandibular dysfunctions on their own</li> </ol>					
<b>Contents of the course:</b> The main strategy of this course is to train the students and prepare them to do the clinical phases in fixed restorations production. The theoretical lectures are dedicated to different topics such as: tooth preparation procedures, temporary fixed restorations, fabricating impressions, jaw relation procedures, application of the articulators, try in procedure, and cementation proceedings as final act. The lectures are well documented with current information showing their actuality through different clinical and laboratory cases.

<b>Course: Clinical Periodontology</b>					
<b>Course Leader (Name, middle letter, surname): Zoran M. Aleksic</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 10</b>			<b>Year of the study: V/ 9<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20PAR2</b>		
<b>Objectives of the course:</b> Training the students to determine the prognosis and to create a treatment plan of periodontitis, to perform the initial periodontal therapy, and to know periodontal surgical procedures which should be used in the treatment of periodontitis and mucogingival conditions.					
<b>Outcomes of the course:</b> Following the completion of the course, the student should be able to: <ul style="list-style-type: none"> <li>- determine the prognosis and to create a treatment plan of periodontal disease</li> <li>- diagnose and treat the periodontal emergencies</li> <li>- perform all the procedures within the initial (nonsurgical) periodontal therapy</li> <li>- perform scaling and root planing</li> <li>- know the indications and contraindications for the surgical therapy of periodontitis and mucogingival conditions</li> <li>- diagnose the symptoms and signs of occlusal trauma</li> <li>- perform occlusal adjustment</li> <li>- perform supportive periodontal therapy</li> <li>- diagnose and treat the recurrence of periodontal disease</li> </ul>					
<b>Contents of the course:</b> Determination of prognosis. Treatment plan of periodontal disease. Nonsurgical periodontal therapy. Periodontal emergencies (acute periodontal abscesses, acute necrotizing ulcerative gingivitis). Occlusal evaluation and therapy. Aggressive periodontitis. Surgical therapy of periodontitis (the flap technique for pocket therapy, resective and reconstructive periodontal surgery, furcation involvement and treatment). Periodontal plastic surgery. Pre-prosthetic periodontal surgery. Restorative interrelationships. Endo-periodontal lesions. Orthodontic treatment of periodontally compromised patients. Standard implant surgical procedures. Localized bone augmentation and implant site development. Supportive periodontal treatment. Recurrence of periodontal disease. Periodontal medicine.

<b>ECTS: 11</b>		<b>Year of the study: V/ 9<sup>th</sup> and 10<sup>th</sup> semesters</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: ST20ENDO</b>		
<b>Objectives of the course:</b> Gaining the necessary knowledge and skills for unaided realization of the endodontic treatment, proper diagnosis and therapy of teeth with diseased pulp and apical periodontium				
<b>Outcomes of the course:</b> After completing the course, the student should be able to: -Possess knowledge of unaided diagnosis and differential diagnosis of pulp disease and apical periodontium -Possess the skills necessary for mastering and applying the methods for the therapy of diseased vital pulp (biopulpectomy, necropulpectomy) in the teeth with simple canal system -Possess the skills necessary for mastering and applying the methods of therapy of diseased nonvital pulp (necrosis, gangrene) and apical periodontal disease in the teeth with simple canal system -Demonstrate the knowledge and skills of the indications and administration of intersession medication -Demonstrate the knowledge and skills of knowing the application of materials and methods of definitive root canal obturation -Demonstrate the knowledge of recognition of faults and complications during endodontic therapy as well as indications for repeated endodontic therapy -Demonstrate the knowledge of different canal retention systems for restoration endodontically treated teeth -Demonstrate the knowledge and skills of knowing the etiological factors of tooth crown discoloration, methods and techniques of bleaching endodontically treated teeth -Demonstrate the knowledge and skills necessary for recognizing root fractures and determining the possibilities for dental therapy depending on the location of tooth fracture and pathophysiological state of the pulp and periodontium -Demonstrate the knowledge and skills related to emergencies in endodontics and how to manage them				
<b>Contents of the course:</b> Asepsis and antisepsis in endodontics; Pain in endodontics; Diagnosis and differential diagnosis of pulp and apical periodontal disease (symptomatic and asymptomatic diseases); X-ray of apical periodontal disease; Endo- perio lesion; Endodontic therapy of symptomatic and asymptomatic pulp and apical periodontal diseases; Pharmacotherapy and application of new technologies in endodontic practice; Urgent endodontic treatment; Endodontic aspect of internal and external resorption ; Errors and complications of endodontic treatment; Endodontic retreatment; Dynamics of reparation after endodontic treatment; Endodontic surgical treatment; Odontogenic tumors; Restoration of endodontically treated teeth; Whitening of endodontically treated teeth Endodontic therapy in risk patients

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>5E1</b>
<b>Level of studies: Second</b>				
<b>Course: Root Canal Obturation - Obturation Techniques and Materials</b>				
<b>Course Leader (Name, middle letter, surname): Mirjana G Vujašković</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>			<b>Year of the study: V / 10<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_01</b>	
<b>Objectives of the course:</b> Acquiring knowledge of bio-physical properties of various types of root canal sealers and methods of root canal obturation.				
<b>Outcomes of the course:</b> After completing the course, students should be able to: <ul style="list-style-type: none"> <li>- explain and analyze biophysical properties of the root canal sealers (advantages and disadvantages)</li> <li>- select the appropriate root canal sealer according to endodontic pathology (inflammatory resorption...) and permanent restoration,</li> <li>- make a plan of the root canal obturation and chose adequate methods of obturation,</li> <li>- perform application of root canal sealers,</li> <li>- explain and perform compaction technique of cold and warm gutta percha cones (advantages and disadvantages),</li> <li>- make a plan for using a cement or a paste as a root canal sealer for obturation single or multiple root canal systems,</li> <li>- consider if apicoectomy is indicated after an endodontic therapy,</li> <li>- know the possibilities of final crown restoration,</li> <li>- analyze and monitor the outcomes of endodontic therapy</li> </ul>				
<b>Contents of the course:</b> Biophysical properties of the conventional and novel root canal sealers (advantages and disadvantages); Types of sealers; Sealer placement; Core materials ; Methods of obturation, lateral compaction, warm vertical compaction, thermoplastic injection technique, carrier based gutta-percha-thermafil, thermomechanical compaction, solvents technique, monocone gutapercha with greater conicity ;type of sealers and methods of obturation depending on the type of restoration of endodontic treated teeth; monitor endodontic treatment outcomes				
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_5_04</b>		
<b>Objectives of the course:</b> Acquiring knowledge of the current concepts of root canal chemical treatment during endodontic therapy				
<b>Outcomes of the course:</b> After successful completion of the course, the student should be able to: -Explain the properties and effects of medicaments used during a chemical treatment of the root canal system, -Differentiate between the techniques and methods for root canal irrigation and decalcification -Describe the concepts and dosage of medicaments used during chemical treatment of a root canal -Analyze preventive measures which eliminate complications of using medicaments and methods for treating complications.				
<b>Contents of the course:</b> Canal system morphology in terms of the possibilities and limitations of a mechanical treatment during endodontic therapy. Medicaments used during endodontic therapy, with their chemical effects on pulp remnants, smear layer and hard wall of root canal, and their ability to dilute, soften and remove them from the canal system. Irrigation protocols and ways to solve the problems related to hard patency of the canal system.				
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>5E5</b>	
<b>Level of studies: Second</b>					
<b>Course: Pain Management in Endodontics</b>					
<b>Course Leader (Name, middle letter, surname): Jugoslav M. Ilić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_05</b>		
<b>Objectives of the course:</b> Acquiring knowledge of the biological background of odontogenic and non-odontogenic orofacial pain, the multidimensional nature of pain, the importance of pain symptoms in endodontic diagnosis, and clinical procedures in successful preoperative and postoperative pain management in endodontic procedure.					
<b>Outcomes of the course:</b> After completing the course, the students should be able to: <ul style="list-style-type: none"> <li>- describe anatomical and pathophysiological background of orofacial pain</li> <li>- differentiate pain of endodontic origin and other types of orofacial pain</li> <li>- associate the type of pain with pathological processes in the dental pulp and periapical dental tissues</li> <li>- explain anaesthetic procedures and medicaments in endodontics</li> <li>- determine appropriate anaesthesia for endodontic procedures</li> <li>- describe analgesic procedures in endodontics</li> <li>- determine the need for anxiolytic premedication for endodontic treatment</li> <li>- plan the pain-management strategy for a particular clinical situation</li> </ul>					
<b>Contents of the course:</b> Pain definitions; classification of pain and pain types; the multidimensional nature of pain; the importance of pain symptoms in endodontic diagnosis; types of anaesthesia; techniques for appropriate anaesthesia in endodontics; failure of anaesthetic procedure; postoperative endodontic pain; analgesics in endodontics; the use of anxiolytics in endodontic pretreatment; sedation and general anesthesia in endodontics; pain-management strategies for different clinical situations.					
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>5E6</b>	
<b>Level of studies: Second</b>				
<b>Course: Visualization Methods in Endodontics</b>				
<b>Professor in charge : Katarina R. Beljic-Ivanovic</b>				
<b>Course status: selective</b>				
<b>ECTS: 3</b>		<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_5_06</b>		
<b>Objectives of the course:</b> To introduce students to all techniques and means for better and more precise diagnostics, therapy plan, follow-up after an endodontic treatment of the pulp and apical tissue diseases, and armamentarium for illumination and magnification.				
<b>Outcomes of the course:</b> After completing the course and passing the exam, the students should be able to: <ul style="list-style-type: none"> <li>- have knowledge of the advantages and disadvantages of radiographic diagnostic means and techniques;</li> <li>- differentiate between 2D and 3D radiographs and indications for their use;</li> <li>- know the basics of analysing 3D images, and their importance and significance in endodontics;</li> <li>- have knowledge of the fundamental parts of an operating microscope and methods for using in the clinical practice</li> </ul>				
<b>Contents of the course:</b> Classification and definition of 2D radiographic extra and intraoral techniques with their specific application and use in endodontics. 3D extraoral radiographic methods with detailed analysis of teeth, surrounding anatomical structures and pathological processes. Presentation of equipment and means for magnification and illumination of the working field: magnification glasses, operating microscope, endoscope and their significance in the clinical work.				
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>5E7</b>	
<b>Level of studies: Second</b>					
<b>Course: Calcium Silicate Cements in Endodontics</b>					
<b>Course Leader (Name, middle letter, surname): Violeta S. Petrović</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_07</b>		
<b>Objectives of the course:</b> Acquiring knowledge of the composition, properties and clinical application of calcium silicate cements used in endodontic therapy of teeth.					
<b>Outcomes of the course:</b> After successful completion of this course, the student should be able to: <ul style="list-style-type: none"> <li>- Describe the composition and setting reactions of calcium silicate cements</li> <li>- Explain the influence of the bonding reactions on physical, chemical and biological properties of the material</li> <li>- Explain the significance of the biological properties for clinical application of the material</li> <li>- Identify differences in the composition and properties of different dental calcium silicate cements (Mineral trioxide aggregate, Biodentine)</li> <li>- Identify indications for the application of the material</li> <li>- Describe the clinical procedure for the application of the material in different indications</li> <li>- Critically analyze the advantages of the calcium silicate cements compared to traditional materials</li> </ul>					
<b>Contents of the course:</b> Composition of the dental calcium silicate cements; setting reactions and setting time; physical and chemical properties; biocompatibility and bioactivity; disadvantages; differences in composition and properties of different commercial products (Mineral trioxide Aggregate, Biodentine); indications for clinical applications, instruments for material application in certain indications; advantages of calcium silicate cements compared to traditional materials.					
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.					
<b>Recommended literature:</b> <ol style="list-style-type: none"> <li>1. Camilleri J. Mineral trioxide aggregate in Dentistry. Springer 2014. Pages 1-214.</li> <li>2. Hargreaves HM, Cohen S. <b>Study program: Integrated Studies of Dental Medicine</b>				<b>5E8</b>	
<b>Level of studies: Second</b>					
<b>Course: Irrigation Systems and Endodontic Protocols</b>					
<b>Course Leader (Name, middle letter, surname): Vanja N. Opačić Galić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_08</b>		
<b>Objectives of the course:</b> To gain knowledge about the importance of the protocols and irrigation during root canal preparation and permanent canal obturation, including the role of the irrigant during pulp therapy complications.					
<b>Outcomes of the course:</b> After completing the course, the students should be able to: <ul style="list-style-type: none"> <li>- Describe the irrigants used for endodontic therapy</li> <li>- Know the mechanisms of their action</li> <li>- Know how to activate the irrigants for more effective results</li> <li>- Choose the adequate combination of irrigants for solving specific therapeutic problems</li> <li>- Knows the side effects of irrigant agents</li> </ul>					
<b>Contents of the course:</b> Irrigants in everyday endodontic practice. Ways of their action, indication and contraindication for use. Interactions between irrigants. Contemporary ways of irrigants activation. Benefits of removing debris, biofilm or medicaments before definitive root canal system obturation. Alternative irrigants (phytotherapy). Benefits of irrigation in the cleaning phase and shaping the canal system in uninfected cases and especially in cases of infected root canals and their complications.					
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>5E9</b>	
<b>Level of studies: Second</b>					
<b>Course: Application of Diode Lasers in Pediatric Dentistry</b>					
<b>Course Leader (Name, middle letter, surname): Jelena Č. Mandić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_09</b>		
<b>Objectives of the course:</b> Acquiring knowledge of the basics of laser technology, multidisciplinary indications for their application, as well as gaining knowledge of clinical procedures for the use of diode lasers on soft tissues of the oral cavity in children.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: - Explain the mechanism of laser beam action on oral tissues in children - Recognize the indications for the use of diode laser in children - Describe the procedures for diode laser operation in pediatric dentistry - Recognize the need for using a diode laser in relation to other surgical techniques in children - Describe the effects and outcomes of laser light on soft tissues in children (excision, coagulation, denaturation, sterilization, etc.) - Develop an effective plan for pain control and postoperative treatment of the treated tissue in children					
<b>Content of the course:</b> Definition, types and classification in preventive and therapeutic application of laser beam in children; multidisciplinary application of laser beam in dentistry; importance of diode laser application in soft tissue surgery in children; the importance of the diode laser in the coagulation, ablation and vaporization of oral soft tissue lesions, the importance of the postoperative sterile field in surgery and endodontics using a soft beam diode laser.					
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Course: Dental Treatment of Patients with Special Care Needs</b>				
<b>Course Leader (Name, middle letter, surname): Markovic Lj. Dejan</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>		<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_5_11</b>		
<p><b>Objectives of the course:</b>                  Undergraduate students should be able to provide urgent treatment and adequate attitude toward dental patients with special care needs. The aim is to remove stigmatization and improve dental care for patients with special care needs, including preventive, prophylactic interventions, therapeutic procedures needed, and to gain enough knowledge to ensure the appropriate decision regarding the best possible individual treatment plan involving behavioral management, sedation or GA dental treatment.</p>				
<p><b>Outcomes of the course:</b>                  After completing the course, students should be able to demonstrate knowledge of:</p> <ul style="list-style-type: none"> <li>- The epidemiological and socio-economic profile of patients with special care needs in a population</li> <li>- The most common disabilities</li> <li>- Communication skills needed for a dental treatment of patients with disabilities</li> <li>- Medical aspects of a dental treatment of patients with special care needs</li> <li>- Oral pathology in patients with special care needs</li> <li>- The dental care of patients with special care needs, including preventive, prophylactic and therapeutic procedures needed.</li> </ul>				
<p><b>Contents of the course:</b>                  The importance of the course. Description of the most common oral pathology in special care needs patients. Building and improving communication skills with special care needs patient during preparation for dental treatment or during a dental treatment itself. Preventive and prophylactic procedures in patients with special care needs – the importance of proper oral hygiene. Behavioral management. Premedication and sedation. Dental treatment under GA. Case reports.</p>				
<p><b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.</p>

<b>Level of studies: Second</b>					
<b>Course: Complex Surgical Treatment of Jaw Cysts</b>					
<b>Course Leader (Name, middle letter, surname): Snježana B. Čolić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_14</b>		
<b>Objectives of the course:</b> Gaining knowledge of the complex procedures used in the treatment of large jaw cysts which jeopardize the adjacent anatomical structures in order to avoid injury of these structures and to ensure successful regeneration of bone tissue.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: <ul style="list-style-type: none"> <li>- establish a diagnosis of the jaw cyst based on the radiograms,</li> <li>- determine whether there is a risk of injury of adjacent anatomical structures and how the injury can be avoided</li> <li>- make a treatment plan for each type of jaw cysts</li> <li>- describe the therapeutic procedure for removal of jaw cysts</li> <li>- recognize possible complications and ways to avoid or minimize them</li> </ul>					
<b>Contents of the course:</b> Diagnosis of jaw cysts based on radiogram analysis; characteristics of different jaw cysts; differential diagnosis with respect to other cystic lesions; literature review; methods and techniques used in the treatment of jaw cysts; complete procedures of different techniques for the enucleation and decompression of jaw cysts; development of a therapy plan; identifying the risk of injury to adjacent anatomical structures; identifying the risk of intraoperative and postoperative complications; monitoring of postoperative healing in order to diagnose relapse.					
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>5E15</b>
<b>Level of studies: Second</b>				
<b>Course: Periapical Microsurgery</b>				
<b>Course Leader (Name, middle letter, surname): Božidar M. Brković</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>		<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_5_15</b>		
<b>Objectives of the course:</b> Acquiring clinical knowledge of the microsurgery approach to the treatment of chronic periapical lesions, microscopic and microsurgical techniques and the application of biomaterials for the surgical root canal obturation.				
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: <ul style="list-style-type: none"> <li>- Describe diagnostic procedures using CBCT for the periapical and endo-periodontal lesions</li> <li>- Recognize the indications for periapical microsurgery and types of magnification during surgical work</li> <li>- Relate the success of the results achieved to the application of microsurgical approach</li> <li>- Explain periapical microsurgical procedure and used techniques</li> <li>- Select the appropriate approach to the choice of materials for retrograde or orthograde obturation of the root canal</li> <li>- Present an efficient surgical plan for the microsurgical therapy of periapical and endo-periodontal lesions</li> </ul>				
<b>Contents of the course:</b> The definition of the term and the importance of the periapical surgery, the importance and the type of microsurgical approach in the periapical surgery and used techniques, diagnosis of periapical and endo-periodontal lesions using the CBCT technique, selection of magnification in the course of surgical treatment, microsurgical instruments and characteristics of biomaterials in the orthograde and retrograde root canal treatment.				
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Level of studies: Second</b>					
<b>Course: Radiographic Techniques in Oral Surgery</b>					
<b>Course Leader (Name, middle letter, surname): Miroslav M. Andrić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_16</b>		
<b>Objectives of the course:</b> To introduce students to the contemporary three-dimensional radiographic techniques used in the clinical practice of oral surgery					
<b>Outcomes of the course:</b> After completing the course, students should be able to: <ul style="list-style-type: none"> <li>- Describe radiographic techniques used in oral surgery</li> <li>- Implement principles of radiation protection</li> <li>- Establish the indications for radiographic examination in oral surgery</li> <li>- Recognize radiographic features of common oral pathology</li> <li>- Interpret radiographic findings in the context of other diagnostic methods</li> </ul>					
<b>Contents of the course:</b> Radiographic techniques, MSCT and CBCT, principles of radiation protection, selection of appropriate radiographic techniques, radiographic features of inflammatory, developmental and neoplastic diseases of the oral and maxillofacial region, radiographic planning of surgery – extraction of impacted teeth, odontogenic cysts and tumors, placement of dental implants, radiographic follow up after a removal of cysts and tumors, dental implants placement, reconstructive procedures.					
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.					
<b>Recommended literature:</b> T. A. Larheim, P-L. Westesson: Maxillofacial Imaging. Berlin: Springer; 2006. pp. 1-85; 119-141; 179-197; 267-307

<b>ECTS: 3</b>			<b>Year of the study: V / 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_25</b>		
<p><b>Objectives of the course:</b> Acquiring knowledge of the indications and contraindications for designing specific forms of fixed dental restorations, minimally invasive therapeutic options, analogue and digital workflow, planning and diagnostic approaches, specification of tooth preparation, taking impressions and temporarization, selection of restorative material: composite, ceramics or hybrid materials, risk factors, complications and causes of failure.</p>					
<p><b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to:</p> <ul style="list-style-type: none"> <li>- describe the indications and contraindications for developing specific forms of fixed dental restorations;</li> <li>- describe the basics of analog and digital protocol;</li> <li>- describe the basics of tooth preparation;</li> <li>- explain adhesive cementation techniques and types of dental materials;</li> <li>- describe the specificities of different forms and types of specific dental restorations.</li> </ul>					
<p><b>Contents of the course:</b>            Indications and contraindications of therapy; Minimally invasive therapeutic options; Analog and digital operation protocol; Planning and diagnostic approach; Analysis of dentofacial and gingival aesthetics; Adhesive techniques in producing fixed dentures; Specific features of tooth preparation, making impression and temporarization; Adhesive cementing; Choice of restorative materials: composite, ceramic or hybrid materials; Adhesive crowns and bridges; Endocrowns; Veneers - vestibular, palatal and occlusal; Tooth abrasions and therapeutic solutions; Risk factors, complications and causes of failures.</p>					
<p><b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.</p>					
<p><b>Recommended literature:</b>            Galip Gurel. Porcelain laminate veneers. London: Quintessence Publ. Co ltd; 2003. Page :231-345.</p>

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>5E26</b>	
<b>Level of studies: Second</b>					
<b>Course: Esthetic Principles of Dental Restorations</b>					
<b>Course Leader (Name, middle letter, surname): Aleksandra Špadijer Gostović</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: V/ 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_26</b>		
<b>Objectives of the course:</b> Introduction and application of esthetic analyses and esthetic principles of planning and designing fixed, removable and implant supported restorations					
<b>Outcomes of the course:</b> After completing the course, the students should be able to: - participate in planning esthetic aspects of prosthodontic and implant treatment; - perform esthetic analyses, diagnostic wax-up and mock-up procedure; - demonstrate knowledge of the colors in human dentition, conventional and instrumental methods of colour matching and shading.					
<b>Contents of the course:</b> Esthetic dentistry-introduction and development; Clinical esthetic analyses of facial and dentofacial macro-esthetics; Fundamental subjective and objective criteria for esthetic integration; White and pink esthetics; Dental teamwork and demands of interdisciplinary approach in planning, designing, esthetic shaping and producing different types of conventional and implant restorations; Esthetic elements based on photology, light/dark, contrast, assimilation and background effects, importance of photo documentation; Analog and digital workflow; Esthetic considerations in implant prosthodontic therapy; Temporary restorations; Esthetic principles of fixed and removable restorations; Color phenomenon - color perception, expression, harmonization and interaction; Colors in human dentition and their impact on esthetic success; Color determination procedure- shade guide systems and instrumental methods					
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Course: Ceramic Systems in Prosthodontics</b>					
<b>Course Leader (Name, middle letter, surname): Kosovka B.Obradović Đuričić</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: V/ 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_27</b>		
<p><b>Objectives of the course:</b> To inform students about different ceramic materials treated by technological and laboratory procedures to produce fixed prosthetic dental restorations.</p>					
<p><b>Outcomes of the course:</b> After completing the course, students should be able to:</p> <ol style="list-style-type: none"> <li>1. be informed about the possibilities of using ceramic materials for fabricating fixed dental restorations</li> <li>2. know the laboratory and practical characteristics of the ceramic systems</li> <li>3. make proper decisions in terms of the material that will be used in dental therapy</li> </ol>					
<p><b>Contents of the course:</b> The course comprises lectures dealing with the classification of ceramic systems, indications for their use in the practical work, ceramic inlay, onlays and veneers. The special segment will be dedicated to ceramic materials which are used in implantology and restoration of the nonvital teeth. This course also deals with aesthetic principles of the reconstruction of damaged teeth using ceramic restorations, colour phenomena and specificity in cementation procedures.</p>					
<p><b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.</p>

<b>Study program: Integrated Studies of Dental Medicine</b>			<b>5E28</b>	
<b>Level of studies: Second</b>				
<b>Course: Zirconia in Prosthetic Dentistry</b>				
<b>Course Leader (Name, middle letter, surname): Miodrag Šćepanović, Aleksandar Todorović</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>			<b>Year of the study: V/ 10<sup>th</sup> semester</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_28</b>	
<b>Objectives of the course:</b> Since the usage of Zirconia is expanding in dentistry, students will learn the advantages and disadvantages of this material.				
<b>Outcomes of the course:</b> After completing the course, students will be trained to properly indicate the use of Zirconia. They will also be trained to prepare a tooth for Zirconia restorations and will acquire knowledge of clinical and lab steps in analogue and digital workflow in producing Zirconia restorations.				
<b>Contents of the course:</b> Development, chemical and physical properties of Zirconia; Esthetic properties of Zirconia; Different concepts for producing fixed Zirconia restorations: layering, cut-back, monolithic constructions; Tooth preparation concepts for Zirconia restorations; Additional devices for teeth preparations- magnification; Zirconia restorations in implantology; Conventional impression for Zirconia restorations; Digital impression concept; Digital impression of prepared teeth; Digital impression for implant retained restorations; Cementing of Zirconia fixed restorations; Lab processes in producing Zirconia restorations; Types of Zirconia for dental practice and lab use; Devices for producing Zirconia restorations; Complications related to Zirconia.				
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Course: Orofacial Pain in Patients in Dental Prosthetics</b>					
<b>Course Leader (Name, middle letter, surname): Igor S. Đorđević</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: V/ 10<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_5_29</b>		
<b>Objectives of the course:</b> Introducing students to the basics of the onset, recognition, and control of pain in the orofacial region					
<b>Outcomes of the course:</b> After completing the course, the student should be able to: - assist in the dental practice during different stages of clinical examination of a patient with pain and recognize the type and origin of the present painful symptoms - use special questionnaires to evaluate and analyze painful conditions - demonstrate knowledge of the specifics of the therapeutic control of orofacial pain					
<b>Contents of the course:</b> Students will expand their knowledge of the concept of orofacial pain, epidemiology, anatomical and physiological considerations of the onset of orofacial pain; patient assessment of the pain: triage screening and detailed clinical examination, diagnostic systems for orofacial pain and differential diagnosis, a multidisciplinary approach in the control of orofacial pain and algometric techniques and methods in the assessment of pain intensity, the concept of TMD and muscle pain dysfunction: appearance of acute and chronic muscle pain; a multidisciplinary approach in the control of orofacial pain.					
<b>Content of the professional practice:</b> Professional practice encompasses supervised practical work with the aim of fostering students' practical skills and instilling techniques required for establishing a good rapport with patients.

<b>Course Otorhinolaryngology</b>					
<b>Course Leader (Name, middle letter, surname): Rade M Kosanovic, Snezana P. Sankovic-Babic</b>					
<b>Course status (compulsory/elective): Compulsory</b>					
<b>ECTS: 5</b>			<b>Year of the study: VI / 11<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20ORLA</b>		
<b>Objectives of the course:</b> Introducing the students of Dental Medicine to clinical assessment of the basic otorhinolaryngological pathology which is of importance for dental practice.					
<b>Outcomes of the course:</b> After completing the course, the students should be able to: <ul style="list-style-type: none"> <li>- examine ENT patients</li> <li>- use all ENT instruments for ENT diagnosis and recognize the diagnostic procedures of audiometry, nasal endoscopy, indirect laryngoscopy (microlaryngoscopy) esophagoscopy and bronchoscopy, CT tomography</li> <li>- solve acute conditions in ENT region</li> <li>- recognize the principles of malignant diseases and treatment of laryngectomized patients and patients with tracheostomy</li> <li>- understand the basic clinical principles in diagnostics and treatment of acute and chronic inflammation of the ear, nose and throat mucosa</li> <li>- understand the basic clinical testing of patients with vestibular disorders and principles of the main otorhinolaryngological operations</li> </ul>					
<b>Contents of the course:</b> Anatomy of the ear, nose , throat and larynx. Congenital disorders of the ENT regions. Injuries of the ENT regions. Urgent conditions in ENT -epistaxis and tracheostomy. Acute inflammation of the ear, nose and throat acute inflammation of the larynx. Chronic inflammation of the ear nose and throat. Tumors of the ear nose and throat, diagnosis and surgical therapy. Audiology introduction to the basic clinical conditions and disorders of the inner ear. Surgical therapy of the inner ear diseases. Basic principles of phoniatriy. Diseases of the oesophagus. Diseases of the trachea and bronchi.

<b>Course: Forensic Medicine</b>				
<b>Course Leader (Name, middle letter, surname): Dragana Ž. Puzović</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 5</b>		<b>Year of the study: VI / 12<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):/</b>		<b>Course code: ST20SUME</b>		
<b>Objectives of the course:</b> Introducing students to various types of violent health impairment, principles and medical criteria of the forensic medical expertise of body injuries, the importance of odontostomatological data in the process of identification of unknown living individuals and corpses. Introducing students to the obligations of a doctor of dentistry, keeping dental records and criminal acts related to the medical profession.				
<b>Outcomes of the course:</b> Mastering the diagnostics and principles of the forensic medical expertise of maxillofacial mechanical injuries based on established findings and /or dental records. Acquiring knowledge needed to identify unknown living and dead bodies based on odontostomatological data. Acquiring knowledge about legal duties during professional work of dentists and acquiring knowledge regarding criminal responsibility of dentists.				
<b>Contents of the course:</b> Violent harm to health, expertise diagnostics, expertise of injuries based on medical documentation, significance of odontostomatological data for identification, responsibilities of a doctor for criminal acts. Expertise on injuries of the maxillofacial region. Discussing expert reports on injuries.

<b>ECTS: 7</b>			<b>Year of the study: VI / 11<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20IMPL</b>		
<b>Objectives of the course:</b> To train students to establish an individualized treatment plan based on anatomical, physiological, and systemic conditions, as well as based on future prosthetic reconstruction. To introduce students to the basics of dental implant systems, as well as to surgical and prosthetic treatment steps in implant treatment.					
<b>Outcomes of the course:</b> Following the completion of the course, the student should be able to: -obtain the anamnesis, clinical examination and radiographic data analysis -demonstrate knowledge of different implant types and materials used in dental implantology -demonstrate knowledge of the indications and contraindications for dental implant treatment -demonstrate knowledge of the basic clinical principles in implant dentistry -take abutment level and implant level impressions and know the basic prosthetic steps for prosthesis fabrication -demonstrate knowledge of surgical and prosthetic complications -educate patients on oral hygiene maintenance					
<b>Contents of the course:</b> Introduction to oral implantology. Anatomical consideration for treatment planning. Indications and contraindications for implant placement. Risk factors and possible complications of implant treatment. Surgical techniques for implant placement. Prosthetic techniques and procedures for prosthesis fabrication. Soft and hard tissue augmentation procedures. Characteristics of materials for bone augmentation procedures. Dental implants' application in maxillofacial surgery.

<b>Study Programme: Integrated Studies of Dental Medicine</b>				<b>C38</b>
<b>Level of studies: Second</b>				
<b>Course: Dentofacial Orthopedics</b>				
<b>Course Leader (Name, middle letter, surname): Zorana Z. Stamenković</b>				
<b>Course status (compulsory/elective): Compulsory</b>				
<b>ECTS: 10</b>			<b>Year of the study: VI / 11<sup>th</sup> and 12<sup>th</sup> semesters</b>	
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: ST20ORTO</b>	
<b>Objectives of the course:</b> Students are expected to learn the basics of etiology, prevention, diagnostics and treatment of all kinds of malocclusion				
<b>Outcomes of the course:</b> After completing the course, the students should be able to: <ul style="list-style-type: none"> <li>- Demonstrate knowledge of prenatal and postnatal growth and development of orofacial structures</li> <li>- Demonstrate knowledge of the characteristics of the correct occlusion in deciduous, mixed and permanent dentition and determine the terms of normognathism, prognathism and retrognathism</li> <li>- Demonstrate knowledge of the functions of orofacial structures</li> <li>- Demonstrate knowledge of etiological factors which cause different malocclusion types</li> <li>- Perform a clinical examination of patients, produce study casts and perform occlusal diagnostic procedures</li> <li>- Analyze intraoral radiographs, orthopantomography and lateral cephalometrics (points, lines, angular and linear parameters)</li> <li>- Prevent malocclusion in the prenatal and postnatal period</li> <li>- Establish a diagnosis and plan of treatment for patients with irregularities in size and shape of the teeth and the dental arch</li> <li>- Establish a diagnosis and plan of treatment for patients with bite irregularities in sagittal, transversal and vertical direction</li> <li>- Demonstrate knowledge of biological principles of tooth movement and biomechanics</li> <li>- Demonstrate knowledge of the indications for application, fabrication, and plan of treatment using active and functional removable appliances</li> <li>- Demonstrate knowledge of the indications for application and phases of treatment using fixed appliances</li> <li>- Retention</li> </ul>				
<b>Contents of the course:</b> Growth and development of orofacial structures, main characteristics of deciduous, mixed and permanent dentition, orofacial functions and functional analysis, clinical examination in orthodontics, analysis of study casts, roentgen diagnostics in orthodontics, plan of treatment, prevention of different malocclusion, treatment in deciduous and mixed dentition by removable (active and functional) appliances, extraction in orthodontics, treatment with fixed appliances, retention and relapse.

**Table 5.2.** Subject specification

Study program: <b>Integrated Studies of Dental Medicine</b>	<b>C39</b>
<b>Level of studies: Second</b>	
<b>Course: Thesis Defence</b>	
<b>Course status (compulsory/elective): Compulsory</b>	
<b>ECTS: 3</b>	<b>Year of the study: VI / 12<sup>th</sup> semester</b>
<b>Entry requirements (passed exams from the previous years):</b> The student is required to pass all courses within the study program Integrated Academic Studies of Dental Medicine	<b>Course code: ST20ZARA</b>
<p><b>Objectives of the course:</b> Strengthening the student's capacities in terms of: research methodology and writing scientific and professional papers; demonstrating systematized knowledge of the scientific disciplines of clinical dentistry, clinical medicine and basic sciences; using information systems to search national and international databases; gaining experience in presenting scientific research results.</p>	
<p><b>Outcomes of the course:</b> After defending the thesis the student will be expected to: efficiently and effectively search national and international literature from the field; critically evaluate the validity and relevance of published research articles; assess clinical procedures performed in terms of their relevance to dentistry and justify their presentation to the members of the discipline community; collect data from practice; identify and define a clinical or research problem; systematize and present research findings in writing, and prepare a presentation of their research. In the process of conducting research and publishing the results obtained, the student will be expected to adhere to ethical principles and critically evaluate their own findings.</p>	
<p><b>General contents:</b> The student will choose a topic independently and according to their own interests. Supervisors suggest a range of topics associated with clinical dentistry, clinical medicine or basic courses. The thesis will normally include a clinical case report underpinned by the relevant theoretical background of the dental problem addressed. The thesis may also include an experiment, analysis of medical records data or an overview of data obtained from current literature in the field. The thesis should contain:</p> <ul style="list-style-type: none"> <li>*title</li> <li>*introduction (an overview of the theoretical postulates related to the procedures performed in the scientific disciplines of clinical dentistry, clinical medicine or basic sciences; it is particularly important to consider current scientific and expert knowledge of the clinical subject matter)</li> <li>*a clinical case report, experimental report or research problem formulation. This section of the thesis contains a detailed description of the methods applied; suitable clinical photographs, radiographs or a statistical analysis may complement the textual content.</li> <li>*discussion – the case report involves an expert commentary based on previous scientific research, a critical assessment of clinical or research procedures and their possible outcomes, and highlights the significance of continuous evaluation of the achievements.</li> <li>*References – The Vancouver referencing style should be used; the references should be numbered consecutively according to their order of appearance in the text.</li> </ul>	
<p><b>Mode of delivery:</b> The student must submit a print copy of their thesis. The thesis will be evaluated by a Thesis Committee comprised of three faculty members whose specific scientific field corresponds to the particular field of the thesis. The corresponding departments propose Thesis Committee members who are then appointed by the Vice Dean for Teaching and Learning at the beginning of each academic year.</p>

<b>Course: Endoscopic Operations of the Nose and Paranasal Sinuses</b>				
<b>Course Leader (Name, middle letter, surname): Rade Kosanović</b>				
<b>Course status (compulsory/elective): Elective</b>				
<b>ECTS: 3</b>		<b>Year of the study: VI / 11<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>		<b>Course code: I_6_06</b>		
<b>Objectives of the course:</b> Gaining knowledge of the latest diagnostic and therapeutic endoscopic procedures in the nose and paranasal cavities. Introducing students to the pathology of paranasal cavities and presentation of treatment options using endoscopic techniques. Acquainting students with possible complications of endoscopic surgery and methods for treating them.				
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: <ul style="list-style-type: none"> <li>- understand the options for treating the pathologies of the nose and paranasal cavities in terms of endoscopic techniques,</li> <li>- demonstrate knowledge of the principles of performing endoscopic procedures,</li> <li>- demonstrate knowledge of the role of endoscopic methods in the treatment of chronic rhinosinusitis, nasal polyposis and oroantral fistulas,</li> <li>- recognize the patient's condition that requires treatment by using endoscopic techniques,</li> <li>- adopt the concept of endoscopic surgery in the treatment of paranasal cavity diseases.</li> </ul>				
<b>Contents of the course:</b> History and basic diagnostic procedures, ENT examination, nose endoscopy. Analysis of computed tomography imaging necessary for performing endoscopic procedures. Principles of method selection in the treatment of sinus pathology. Indication analysis and presentation of endoscopic operations of the nose and paranasal cavities. Presentation of Contemporary Navigation Endoscopic Sinus Surgery. Presentation of complications of endoscopic surgical interventions and treatment principles.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>6E8</b>	
<b>Level of studies: Second</b>					
<b>Course: Treatment of Head and Neck Malignant Tumors</b>					
<b>Course Leader (Name, middle letter, surname): Petrovic B. Milan</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: VI / 12<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_6_08</b>		
<b>Objectives of the course:</b> Acquiring knowledge of the etiology, symptomatology, diagnosis and treatment of head and neck malignant tumors.					
<b>Outcomes of the course:</b> Upon completing the course and passing the exam, students should be able to: <ul style="list-style-type: none"> <li>- Recognize the risk factors for the development of head and neck malignant tumors</li> <li>- Recognize the symptoms that indicate the presence of an intraoral malignant tumor</li> <li>- Ascertain which diagnostic measures can be used to confirm the presence of a malignant tumor in the maxillofacial region</li> <li>- Refer the patient to the medical specialist for adequate treatment due to a suspicion of cancer</li> <li>- Independently propose the plan for dental preoperative preparation of oncology patients</li> <li>- Explain to a patient the order of steps taken in the treatment of head and neck malignant tumors</li> <li>- Perform postoperative dental protection in oncology patients</li> </ul>					
<b>Content of the course:</b> Definition of malignant tumors. Types of head and neck malignant tumors. Symptomatology of certain malignant tumors in the maxillofacial region. Diagnostic methods used for head and neck oncology patients. Preoperative preparation of oncology patients – dental and general medical. Types of treatment of malignant tumors. Postoperative care. Postoperative dental treatment. Intraoperative and postoperative complications in oncology patients in maxillofacial surgery.

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>6E20</b>	
<b>Level of studies: Second</b>					
<b>Course: Multidisciplinary Therapy in Orthodontics</b>					
<b>Course Leader (Name, middle letter, surname): Zeljko B. Milosavljevic</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: VI / 12<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_6_20</b>		
<p><b>Objectives of the course:</b> To acquaint the students with the possibilities for a cooperation between orthodontists and other dental specialists and how orthodontists can participate in: trauma therapy in children, preparation for prosthodontic-implantology rehabilitation, treatment of periodontally compromised patients, combined ortho-surgical therapy in patients with maxillo-facial deformities and cleft palates, the role of oral surgery in patients with excessive or impacted teeth. Also, students will learn the needs of incorporating other dental specialists in solving complex orthodontic cases.</p>					
<p><b>Outcomes of the course:</b> After completing the course and passing the exam, the students should be able to recognize when it is necessary to include orthodontic therapy as a preparation for a definitive management of complex cases, and when they should include other dental specialists in pre-treatment of complex orthodontic patients. Students will get familiar with the importance of a multidisciplinary approach to the doctrines of contemporary dentistry.</p>					
<p><b>Contents of the course:</b> Orthodontics and pediatric dentistry, orthodontics and oral and maxillofacial surgery and implantology, the cooperation with periodontology, odontology and prosthodontics will be considered; the role of an orthodontist in a multi-specialist team care. The first term is devoted to a discussion about the role of orthodontics in other branches of dentistry, and vice-versa during the second term.</p>

<b>Level of studies: Second</b>					
<b>Course: Orthodontic Mini-implants</b>					
<b>Course Leader (Name, middle letter, surname): Nenad Lj. Nedeljkovic</b>					
<b>Course status (compulsory/elective):</b>					
<b>ECTS: 3</b>			<b>Year of the study: VI / 12<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_6_21</b>		
<b>Objectives of the course:</b> Acquiring a basic knowledge in the field of advanced possibilities for providing a secure absolute anchorage with orthodontic mini-implants in the treatment of orthodontic malocclusions.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: - identify and describe the types of anchorage - understand the basics of skeletal anchorage - understand the basic indications for the use of orthodontic mini-implants in the treatment of orthodontic irregularities - recognize the basic biomechanical principles based on orthodontic mini-implants					
<b>Contents of the course:</b> Types of support and skeletal anchorage bases; parts and characteristics of orthodontic mini-implants, types of orthodontic mini-implants; the manner and place of the application; safe zones for mini-implant applications; loading of mini implants and biomechanics of tooth movement; indications and contraindications for the use of orthodontic mini-implants; therapeutic options.

<b>Level of studies: Second</b>					
<b>Course: Presurgical Orthodontic Treatment</b>					
<b>Course Leader (Name, middle letter, surname): Ivana V. Šćepan</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: VI / 12<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_6_22</b>		
<b>Objectives of the course:</b> Acquiring a basic knowledge of orthognathic surgery diagnostics, setting adequate indications for pre-surgical orthodontic treatment, and proper and timely referral of the patient to specialists in orthodontics.					
<b>Outcomes of the course:</b> After completing the course and passing the exam, the student should be able to: <ul style="list-style-type: none"> <li>- Understand and demonstrate knowledge of the indications for combined orthodontic and surgical treatment of dentofacial deformity</li> <li>- Clearly explain the purpose, plan and possible complications of the treatment</li> <li>- Demonstrate knowledge of the possibilities and limitations of orthodontic therapy, and the possibilities of modern orthognathic surgical treatment</li> <li>- Demonstrate knowledge of the principles of orthodontic therapy of patients with various dentofacial deformities of the face and jaw in order to prepare them for a surgical correction</li> <li>- Demonstrate knowledge of cephalometric planning as well as treatment planning on study models for patients with dentofacial deformity</li> <li>- - Demonstrate knowledge of possible surgical and orthodontic complications during the treatment of facial and jaw deformities, including patients with cleft face, lips and palate, and patients with craniofacial deformities.</li> </ul>					
<b>Contents of the course:</b> Indications for orthognathic surgical treatment, psychosocial considerations in orthodontics and surgery, medical documentation before surgery, differential diagnosis of dentoalveolar and skeletal minorities, specificities of orthodontic therapy in combined orthognathic surgical treatment, pre-surgical orthodontic treatment the door

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>6E24</b>	
<b>Level of studies: Second</b>					
<b>Course: Up-To-Date Radiology In Dentistry</b>					
<b>Course Leader (Name, middle letter, surname): Biljana B. Markovic Vasiljkovic</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: VI / 11<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_6_24</b>		
<p><b>Objectives of the course:</b> The goal of the course Up-to-date radiology in dentistry is to familiarize the students with modern imaging methods used in diagnosing diseases of the maxillofacial region (computerized tomography, ultrasound, magnetic resonance, hybrid imaging etc.), the principles of image formation and analysis obtained by these methods, as well as the principles of patient protection during performing these radiological methods. The objective of the course is for the student to gain knowledge about the possibilities of radiological monitoring and control of the treatment of various diseases of the splanchnocranium.</p>					
<p><b>Outcomes of the course:</b>            After completing the course and passing the exam, the student should adopt the knowledge of the principles of performing examination with modern radiological methods:</p> <ul style="list-style-type: none"> <li>- Ultrasound</li> <li>- Computed tomography</li> <li>- Dental volumetric computed tomography</li> <li>- Magnetic resonance imaging and nuclear medical methods, used in the diagnosis of diseases of the maxillofacial region.</li> <li>- Student will be introduced to the diagnostic presentation and evaluation of the more and less common pathological conditions in dentistry.</li> <li>- They will gain basic knowledge of reconciling imaging findings and hybrid imaging.</li> <li>- Will be able to select and refer the patient to an appropriate diagnostic procedure based on the clinical findings.</li> </ul>					
<p><b>Contents of the course:</b>            Possibilities of standard digital orthopantomography and cone-beam technique in diagnosing pathological changes in the face and jaw region. Computed tomography method: principles and examination techniques and application in diagnosis of diseases of the face and jaw region. Magnetic resonance imaging: review principles and techniques and application in diagnosis of diseases of the face and jaw region. Ultrasound method: principles and techniques of examination and application in diagnostics of diseases of the face and jaw region. The basic principles of nuclear medicine and possibilities of its application in diagnostics of diseases of the face and jaw region. Principles of selection and comparison of procedure results in evaluation of pathological changes in the face and jaw region. The importance of consiliary examination of patients with diseases of the face and jaws.</p>

<b>Study program: Integrated Studies of Dental Medicine</b>				<b>6E25</b>	
<b>Level of studies: Second</b>					
<b>Course: Computerized Dentistry</b>					
<b>Course Leader (Name, middle letter, surname): Aleksandar B. Todorović</b>					
<b>Course status (compulsory/elective): Elective</b>					
<b>ECTS: 3</b>			<b>Year of the study: VI / 11<sup>th</sup> semester</b>		
<b>Entry requirements (passed exams from the previous years):</b>			<b>Course code: I_6_25</b>		
<b>Objectives of the course:</b> Obtaining the theoretical and practical knowledge of computer technology and its applications in dentistry					
<b>Outcomes of the course</b> After completing this course, the students should be able to demonstrate theoretical knowledge concerning the application of computer technologies in the following areas: management in dentistry, e-learning, expert systems, databases, simulations, diagnosis and treatment, computer aided inspection, computer aided design, computer aided manufacturing, computer application in diagnosis and treatment of TMJ disorders, digital photography, digital radiology, computer guided implantology and analysis of the models and images in the diagnosis of malocclusion.					
<b>Contents of the course</b> The subject of computerized dentistry is based on the premise that information technology has the potential to help dentistry realize its vision of improving individual and general oral health systematically and consistently. Advances in the integration of computer technology, as well as innovations in digital imaging, signal processing, intra- and extra-oral digitalization, data visualization, information and knowledge representation can fundamentally improve therapeutic and diagnostic treatments in dentistry. The lectures cover the application of computers in education, therapy and diagnostics, CAD/CAM technologies, computer guided implantology and also include computer application in orthodontics and endodontics. Practical training involves digital shade matching, computer application in the implant planning, basic functions of CAD/CAM systems, computer simulation of orthodontic treatment plan, digital intra- and extra-oral photo imaging and analysis of digital images.
